Dr. Marabeth Kramer

CARING FOR YOUTH WITH HIGH-RISK SUBSTANCE USE: DEFINING ADMISSION TO A TERTIARY PEDIATRIC HOSPITAL

Marabeth Kramer

Research Supervisors: Drs. Eva Moore, Danya Fast

Celebrate Research Day

UBC Department of Pediatrics

April 12, 2024

BACKGROUND (1)

- BC is at the epicentre of the opioid crisis in North America
 - Since 2014 cause of death from unintentional illicit drug overdose has risen dramatically – largely due to synthetic opioids¹
- Youth have not been spared
 - Death due to drug overdose continues to be the leading cause of death for adolescents (~24 deaths/year)¹

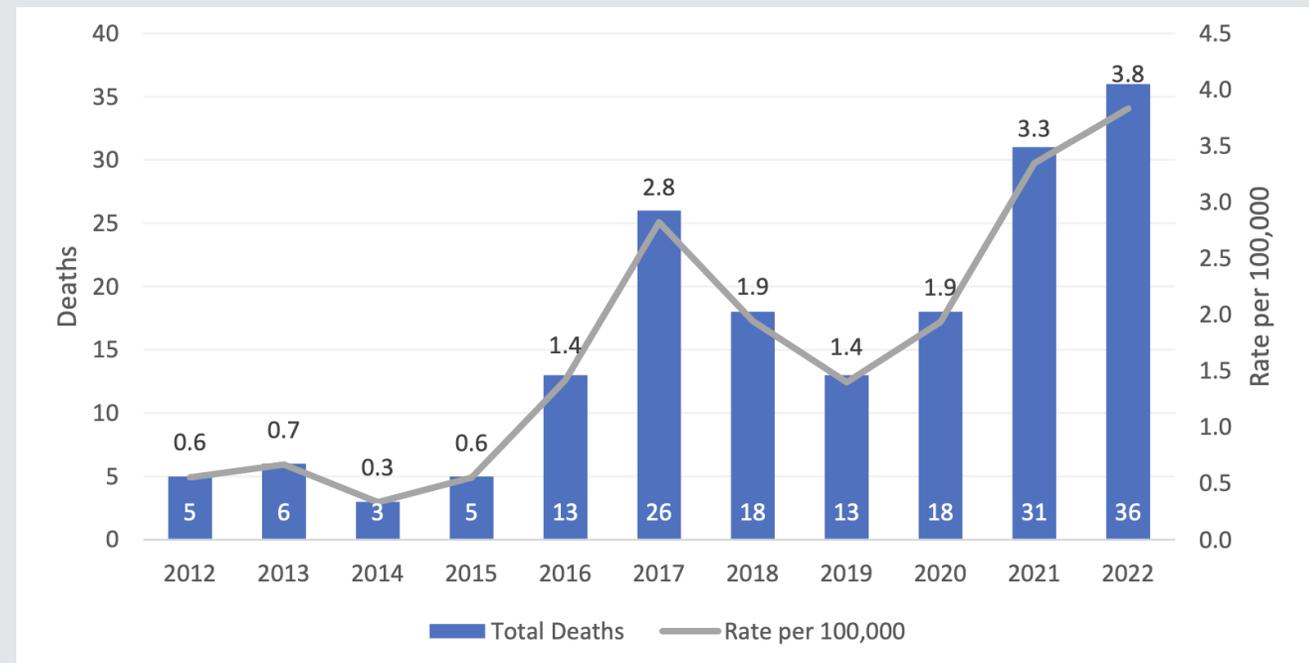

Figure 2: Youth unregulated drug toxicity deaths and rates of death per 100,000 by year 2012-2022¹

BACKGROUND (2)

- Youth who use substances are particularly vulnerable
 - Critical period of brain development → neurobiological impacts², pattern of chronic addiction³
 - Associated with significant morbidity^{3,4}
 - Services are piecemeal, often not age or culturally appropriate; youth not offered full harm reduction services^{2,5,6}
- Debate continues regarding best approach for treatment of youth who present with life-threatening overdose or drug use
 - Few evidence-based guidelines⁷
 - Role of pediatric hospitals is undefined

RESEARCH AIMS

- Define the population of youth admitted to BC Children's Hospital for substance use-related admissions
- Determine scope of care being offered to these youth
- Explore outcomes of admission
- Apply an ethical and quality improvement lens to care for youth with high-risk substance use
 - Work towards evidence-based care
 - Disseminate results to influence clinical practice and policy

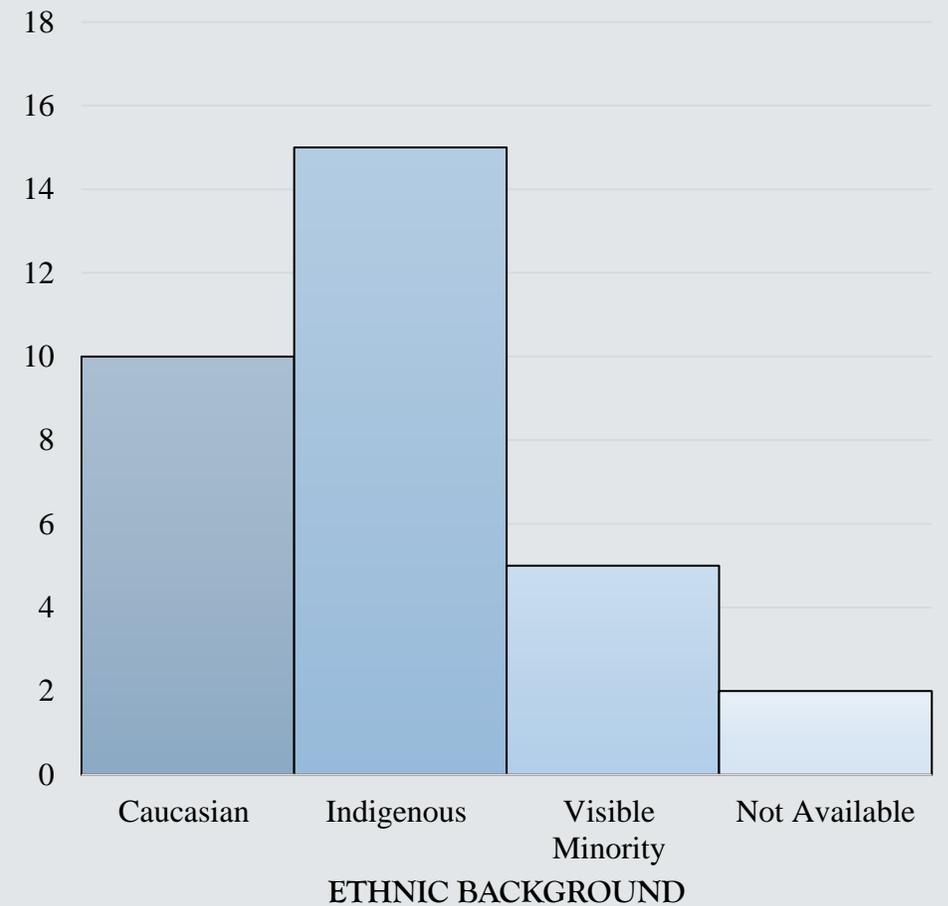

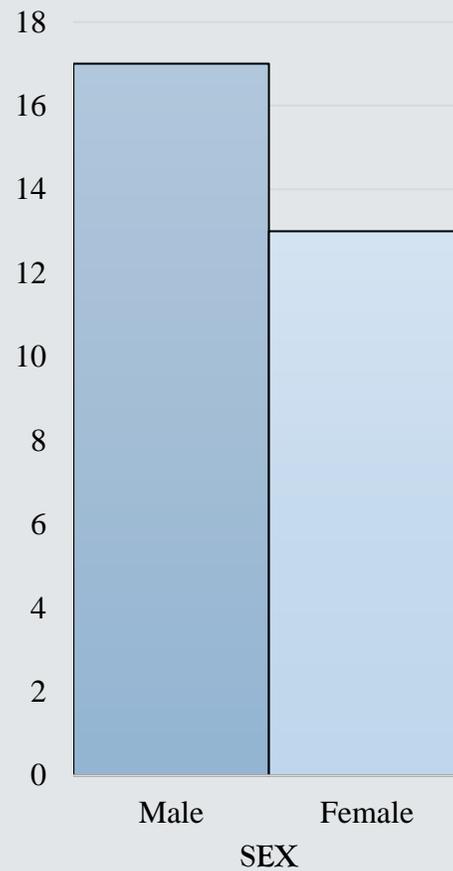

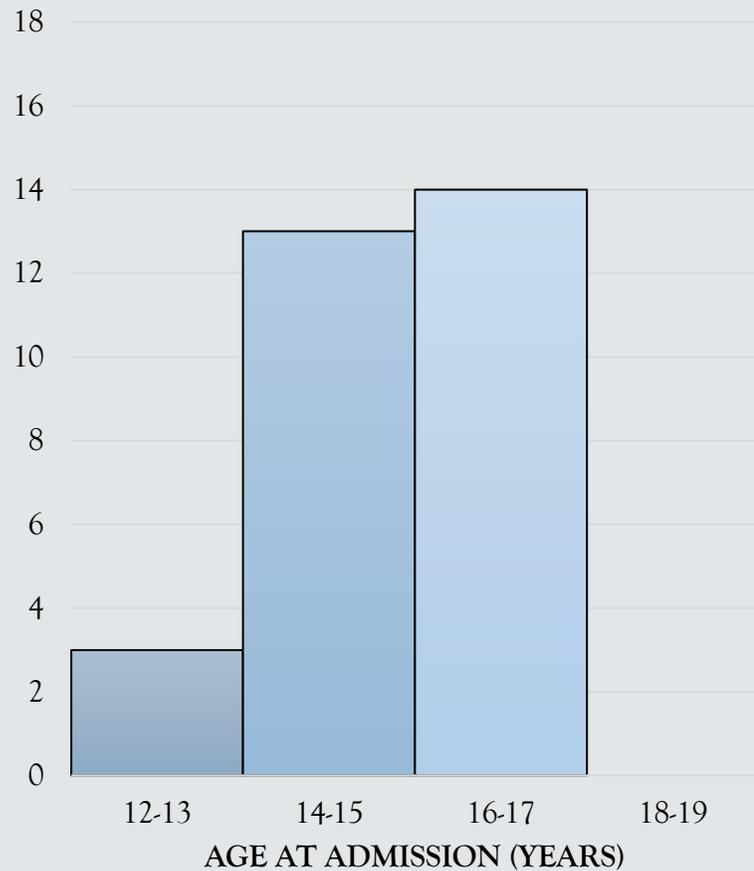

STUDY DESIGN (1)

- Descriptive, hypothesis-generating study
- Retrospective chart review
 - Youth aged 12-19; convenience sample
 - Admitted to hospital between June 1, 2018 and May 31, 2021
 - Reason for admission → life threatening overdose, or complications of substance use
 - Repeat admissions for the same youth were reviewed
 - Exclusion criteria: managed in ED only, Adolescent Medicine not involved in admission
- Sample: 44 admissions to hospital, and 30 youth

STUDY DESIGN (2)

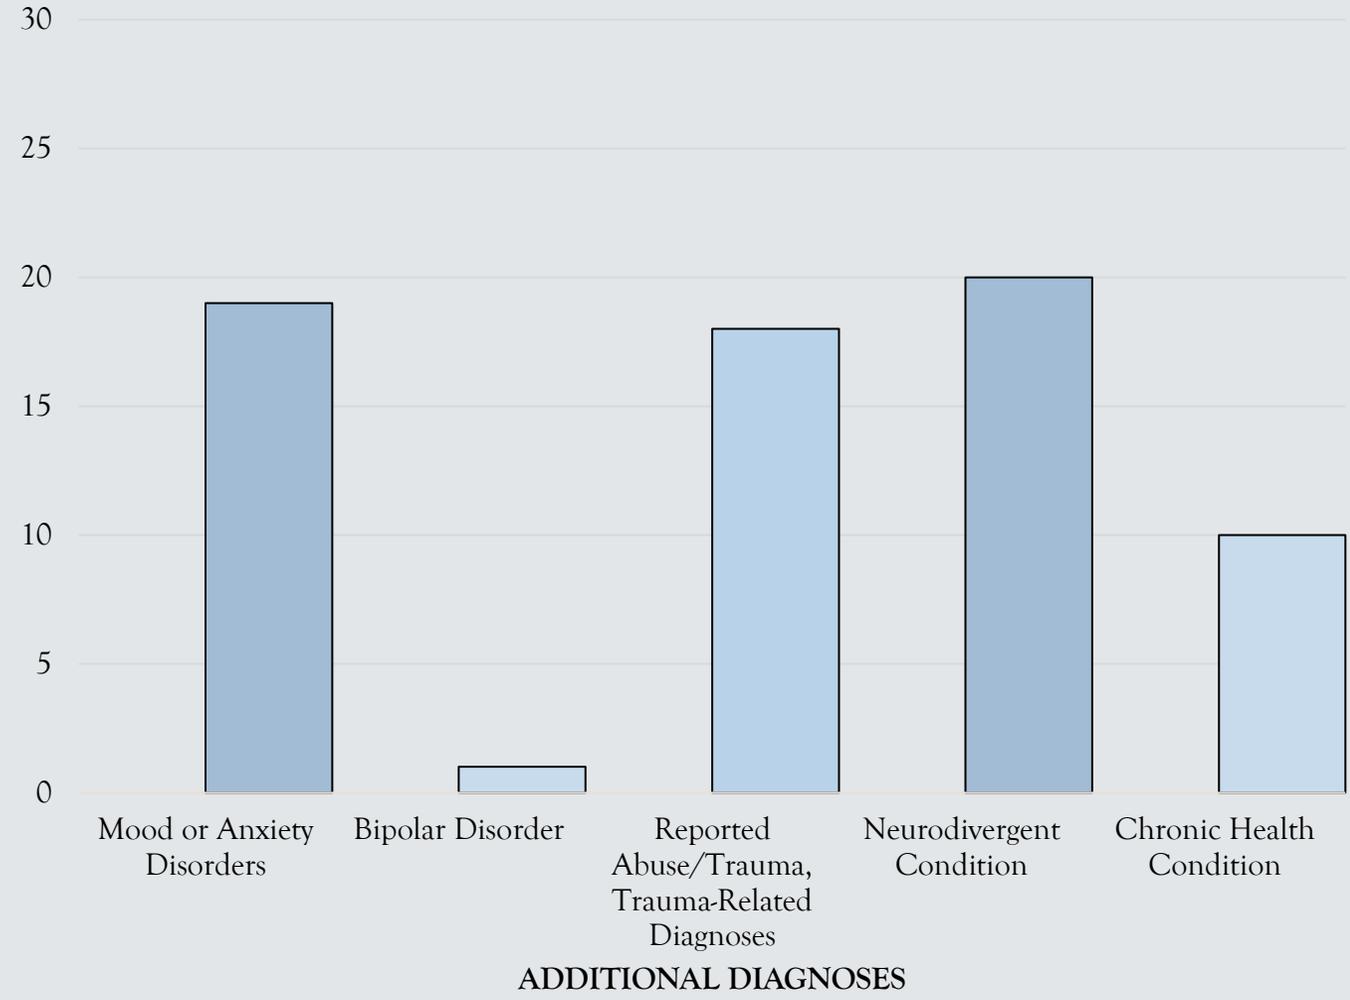

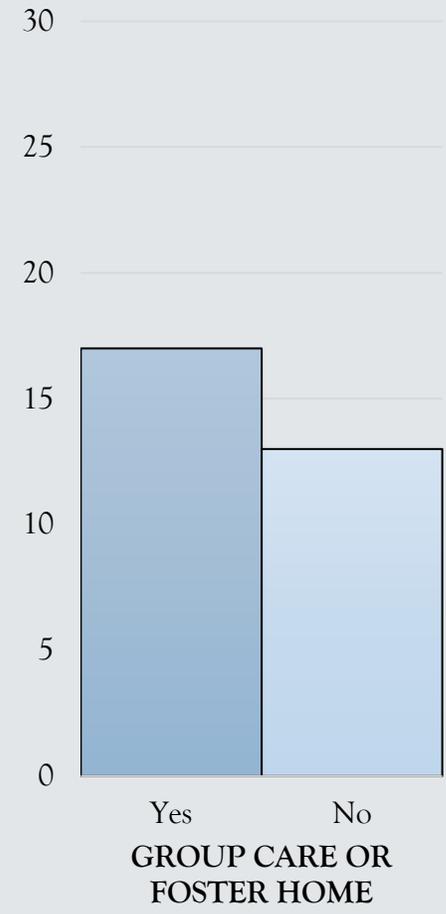

- Electronic charts (Old Cerner, Care Connect; all physician and allied health notes) were reviewed → data were collected to Excel file
- Primary outcome: baseline demographic characteristics of youth
- Secondary outcomes:
 - Summary data regarding course in hospital
 - Outcomes of admission
- Statistical analysis was descriptive and was completed using Excel

RESULTS: DEMOGRAPHICS

n = 30

RESULTS: DEMOGRAPHICS

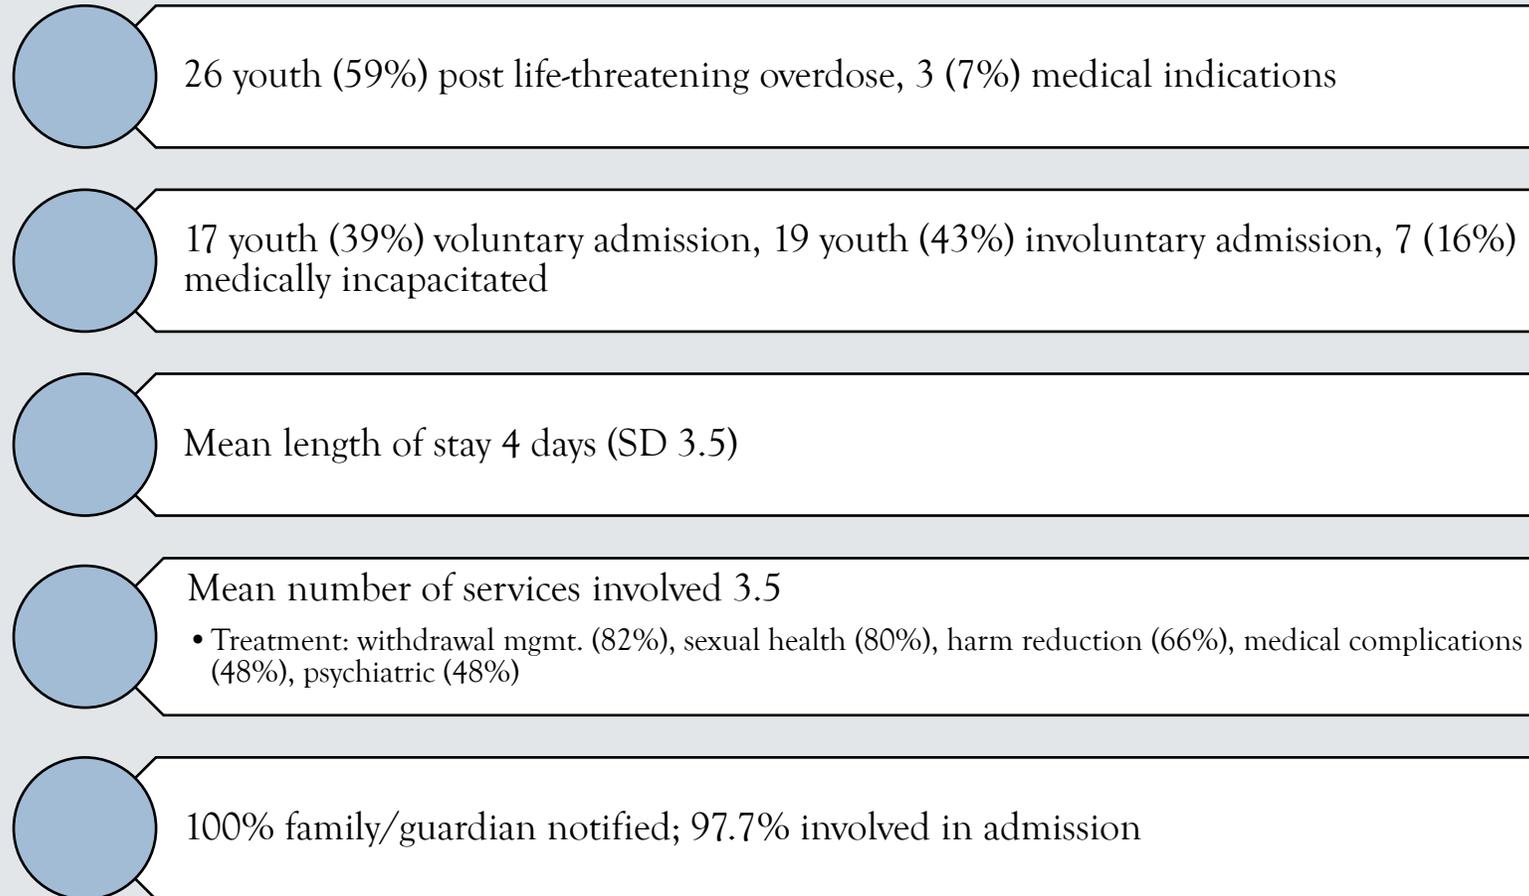

n = 30

RESULTS: SUBSTANCE USE

- Onset of drug use
 - Any substance = mean 12.8 years (range 6-16 years)
 - Substance related to admission = mean 13.6 years (range 11-16)
- Reported substance use (youth or parent/guardian report) – all polysubstance use
 - Many reported regular nicotine (50%), cannabis (60%), alcohol (47%) use
 - Ever use of benzodiazepines (40%), opioids (67%), and stimulants (83%)
- 21 youth (70%) had overdose requiring resuscitation at least once
- 5 youth (17%) had previously been prescribed opioid agonist therapy (OAT)

RESULTS: ADMISSION

n = 44

RESULTS: OUTCOMES

- Discharge setting: 24 group home or foster care (55%), 11 (25%) family home
- Minority youth-initiated discharges, 4 youth (9%)
- 11 youth (25%) admitted to inpatient substance use treatment
- 4 youth (9%) initiated on OAT
- Connection to services: 32 youth (73%) seen in community setting, 3 (7%) lost to follow up
- 2 youth (4.5%) died post admission

n = 44

LIMITATIONS

- Small study size with possibility of limited generalizability
- Convenience sample – some serious substance-use related admissions may have been missed
- Data for outcomes (particularly in assessing community referral vs. engagement) were difficult to determine from retrospective chart review
- Variability of provider charting and diagnostic process – limitation of hospital chart review
- Thoughts and perspectives of the youth not always captured
 - More focus on resilience and protective factors required

FUTURE DIRECTIONS

- Ongoing concurrent qualitative study – will help to better understand youths’ perspectives regarding admission (as well as family and care providers)
- Dissemination of data and information to better inform practice
 - Need to do this in culturally sensitive manner with input from Indigenous colleagues/stakeholders
- Collect more data to be better powered to compare voluntary vs. involuntary admissions, medical vs. life-threatening overdose admissions

CONCLUSIONS

- Medically and socially complex population of youth with intersecting risk factors
- Admissions are high-intensity, multidisciplinary, and require specialized skill set
 - Capacity to provide this care continues to be strengthened at Pediatric centers
- Brief inpatient admissions for life-threatening substance use may increase initiation of OAT, rate of outpatient, intensive substance use treatment
- Ongoing research needed to inform best practices in caring for youth with high-risk substance use

ACKNOWLEDGEMENTS

- Dr. Moore and Dr. Fast for their guidance and support throughout this process!
- Jeffery Bone for initial descriptive statistical analysis
- Madison Thulien for support with the ethics application
- Japneet Gill for initial data organization, thematic analysis

Dr. Jessica Falls

Improving breastfeeding outcomes for preterm infants in the Mother Baby Care Unit

Jessica Falls, Dr. Shawn George, Sarah Coutts

Background

- Benefits of breastfeeding are well known
- Preterm babies are at higher risk of not establishing exclusive direct breastfeeding
- Transition from nasogastric feeding to oral feeding is major milestone for preterm babies
- The MBC unit promotes mother-baby togetherness

Project Aim

- To enhance breastfeeding rates of preterm infants (<37 weeks) in the Mother Baby Care Unit. Our goal is to increase the current rate from **35% to 80%**

Methods: The Process

ESTABLISH
BASELINE

WORKING GROUP
MEETINGS

DEVELOPMENT
OF CARE BUNDLE

We determined underlying factors contributing to low breastfeeding rates via two methods

ESTABLISH
BASELINE

WORKING GROUP
MEETINGS

DEVELOPMENT
OF CARE BUNDLE

Type	Stats	Objectives	Key findings
Staff surveys	190 responses	Understand values and practices of healthcare workers supporting families with breastfeeding preterm babies	<ul style="list-style-type: none">• Variable understanding of breastfeeding practices and difficulty troubleshooting problems• Breastfeeding was inconsistently discussed during patient rounds and inconsistently discussed with families
Parent experience interview	1	Subjective breastfeeding experience from a parent of a preterm baby	<ul style="list-style-type: none">• Parent had two different experiences with two different healthcare workers

Building upon the baseline, we sought to validate and generate solutions

ESTABLISH

WORKING GROUP
MEETINGS

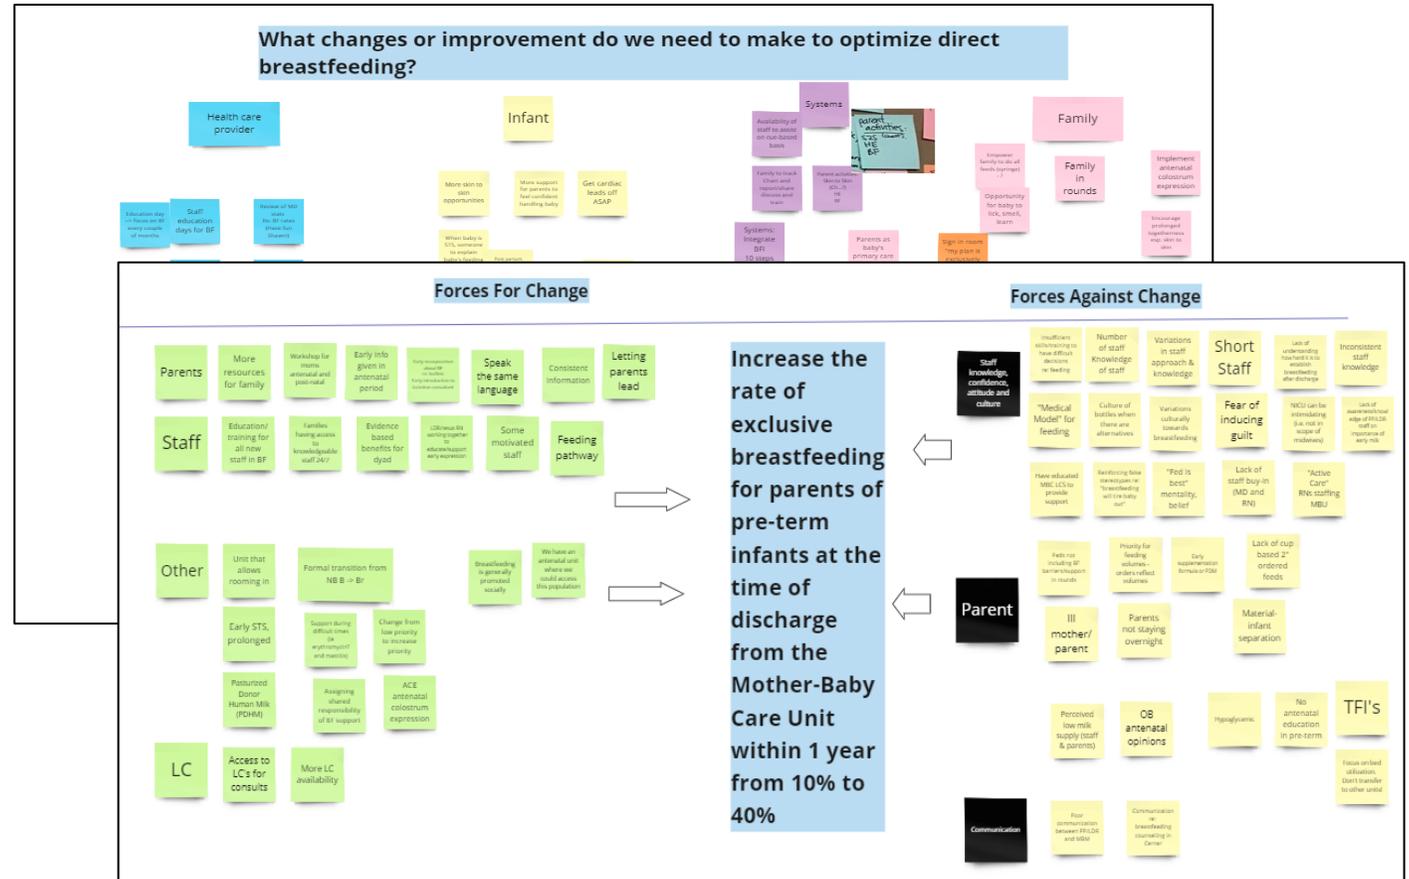

DEVELOPMENT
OF CARE BUNDLE

Challenge Knowledge gap
Solution Staff education

Challenge Lack of standardization
Solution Clinical support tool

Breastfeeding MYTH BUSTERS

BC WOMEN'S HOSPITAL + HEALTH CENTRE
Provincial Health Services Authority

1 MYTH Preterm infants must be 34 weeks to breastfeed
BUSTED! Preterm babies are able to start breastfeeding much sooner than we used to believe. While every baby is different and some babies take longer depending on whether they have other issues, you do not have to wait until a certain age. Studies show that babies under 34 weeks can latch and drink milk. Ask your nurse about feeding cues and ways to support early breastfeeding opportunities, such as continuous skin-to-skin contact.

2 MYTH Bottle feeding my baby will help us go home faster
BUSTED! Bottle feeding your baby in the NICU will not shorten your stay. It may interfere with starting breastfeeding and the length of time you breastfeed. If you plan to breastfeed, we recommend avoiding bottles while you and your baby learn to breastfeed. If your baby needs supplemental milk, try cup feeding.

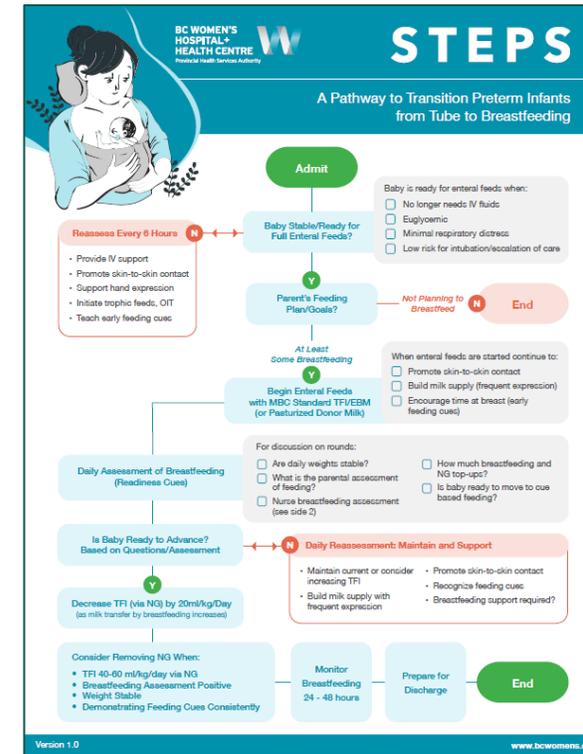

3 MYTH Breastfeeding is painful
BUSTED! Breastfeeding should not hurt. Your nipples may feel sensitive as you are learning to breastfeed, but nipple pain is not normal. Try different positions for breastfeeding and make sure baby is latched deeply on the breast to decrease pain. If that doesn't work ask your nurse or a lactation consultant for help.

4 MYTH Feeding my baby formula is similar to feeding them breastmilk
BUSTED! Breast milk is unique as it changes to meet your baby's needs through every stage of development. Mothers of preterm babies produce breast milk that is slightly different in composition for the first several weeks. The Canadian Pediatric Society recommends exclusive breastfeeding for the first 6 months of life.

5 MYTH Breastfeeding is harder work for my baby than bottle feeding
BUSTED! Studies have shown that bottle feeding might put more stress on the baby. Breastfeeding is physiologically normal for babies and is not stressful. Preterm babies often breastfeed better when they have a deep latch and there is a good flow of milk. Ask your nurse or lactation consultant for ideas to improve milk supply and flow.

6 MYTH Preterm infants need a nipple shield to breastfeed
BUSTED! Most preterm babies do not need a nipple shield to breastfeed. Evidence shows that some babies fed using a nipple shield are less likely to be directly breastfed at home compared to babies breastfed without a nipple shield. Sometimes changing your baby's position and achieving a deep latch can support your baby to directly breastfeed. If you have questions about when nipple shields should be used, please ask your baby's nurse or a lactation consultant. If a nipple shield is needed after trying different techniques, we recommend not introducing one until your milk is flowing well and you received ongoing support with feeding.

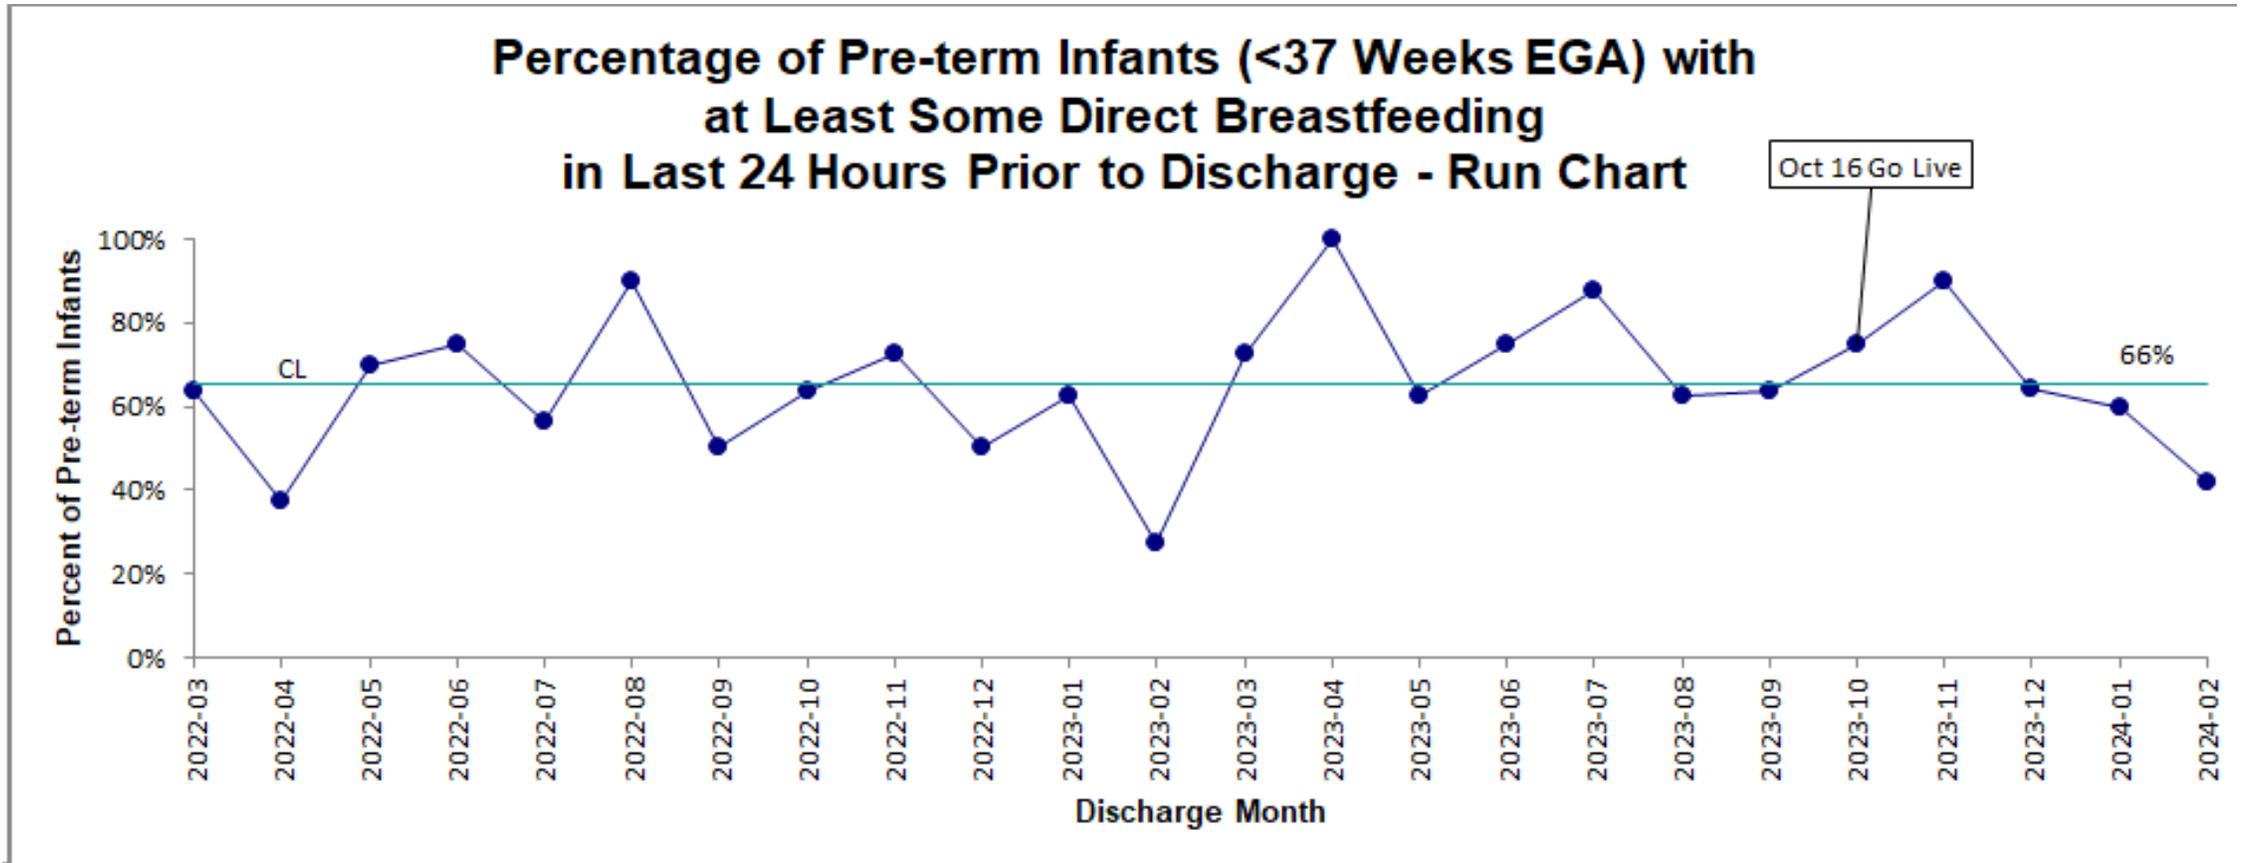

Ask your health care team for questions regarding breastfeeding, or find out more online. www.bcwomens.ca

Methods: The Results

- We used CST Cerner to extract data on feeding route, number of feeds in the 24 hours prior to discharge and the percentage of these which were direct breastfeeding.

We have not noticed improvement from our implemented solution

Limitations

- Limited sample size and high patient turnover
- Differences in practitioner practices and uncertainty of uptake

Conclusions & Next Steps

Conclusions

- Staff beliefs and attitudes can be barrier to change
- Implementation of the care bundle did not see sustained improvement in rate of direct breastfeeding at discharge

Next steps

- There needs to be ongoing education and support provided to healthcare workers for consistent care + information provided to parents
- Change management takes time, so we'll continue to monitor breastfeeding uptake in the MBU

Land Acknowledgement

I would like to firstly acknowledge that I am giving this presentation from the traditional, ancestral, and unceded territory of the Musqueam, Squamish, Tsleil-Waututh Nations.

As someone who resides on stolen land, I would also like to acknowledge the stolen and murdered, Indigenous children who have both been discovered and those who have yet to be found.

Outline

Background

Question Development

Methods

Results and Discussion

Limitations

Future Implications

Background

- Suicide is the second leading cause of death in 15-24yo in Canada and worldwide³
- Self-harm is associated with increased suicidal risk and may or may not be associated with suicidal intent¹
- Most common reason for adolescent self-harm is the desire to relieve psychological pain⁸
- Systematic review of 90 studies by Owens et al (2002) estimated that among those who present to hospital for self-harm, 0.5-2% will die by suicide within the year and 5% will die by suicide within 9 years.

Question Development

Who?

- Adolescents ages 10-14yo and 15-19yo

What?

- Rates of self-harm resulting in hospitalization (including hospital transfers)

When?

- 2002 to 2019

Where?

- British Columbia, Canada (specifically the health service delivery areas)

Why?

- Self-poisoning rates are on the rise but are other causes of self-harm also increasing?

Objective

Explore hospitalization trends in BC
due to all causes of self-harm
(excluding self-poisoning) in youth
ages 10-19 years old from 2002-
2019.

Methods

- Hospitalization and death rates were extracted from the Discharge Abstract Database, BC Ministry of Health
- Stratified according to the ICD-10 codes (International Classification of Diseases, tenth revision)

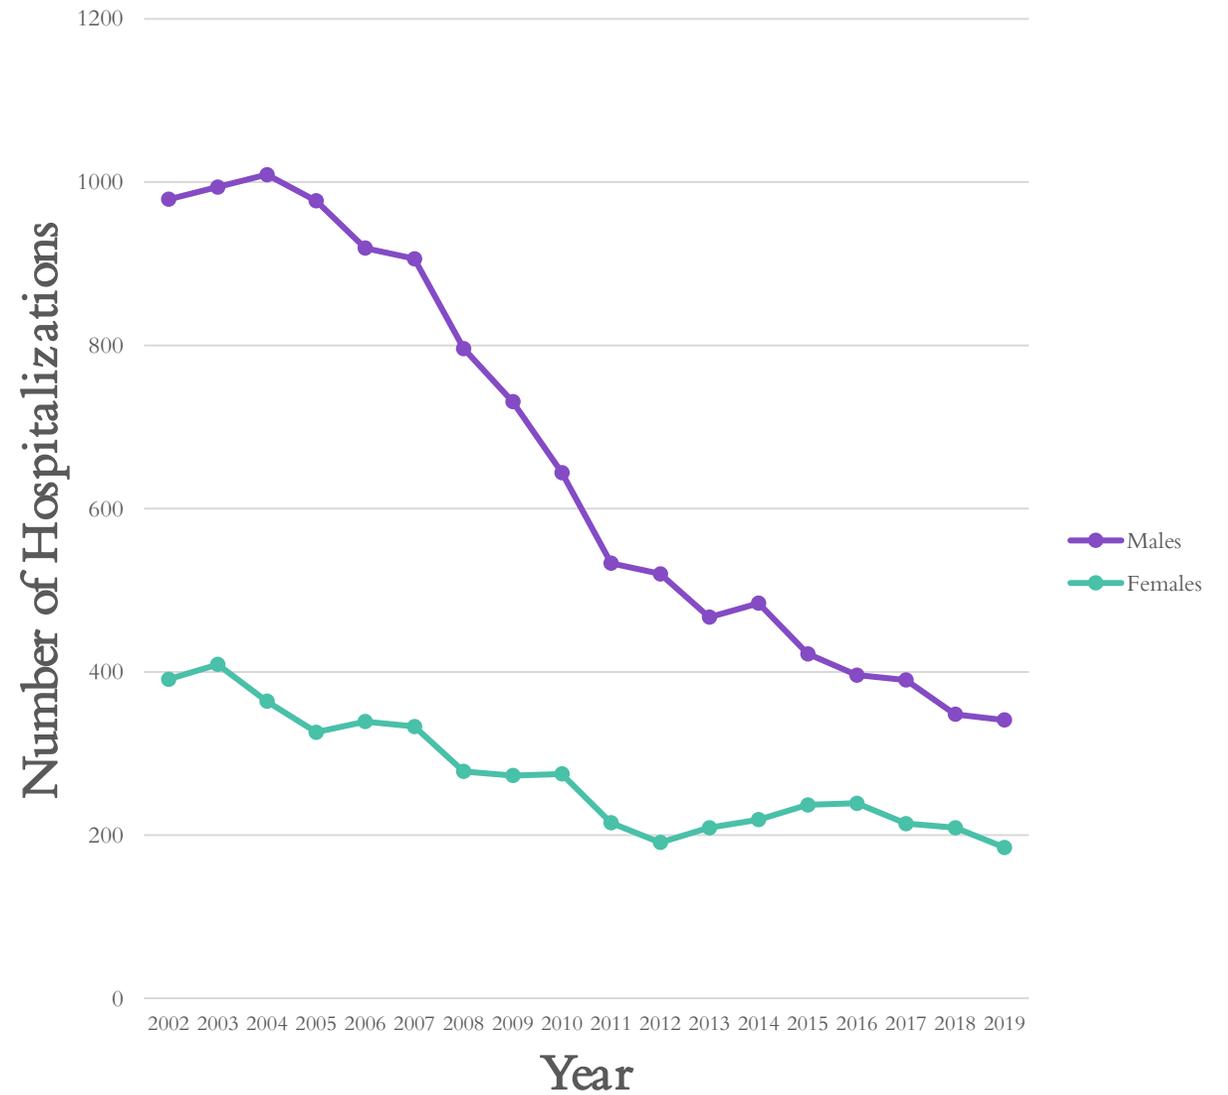

Results

Hospitalization rates for Year by Sex

2002: Males 2.5 times higher than females

2019: Males 1.8 times higher than females

Current Literature

Males:

- More likely to die by suicide, less likely to attempt suicide c/o females
- More likely to use more lethal means (ie. firearms)⁷

Females:

- More likely to self-harm, less likely to die by suicide
- Less likely to use more lethal means⁷

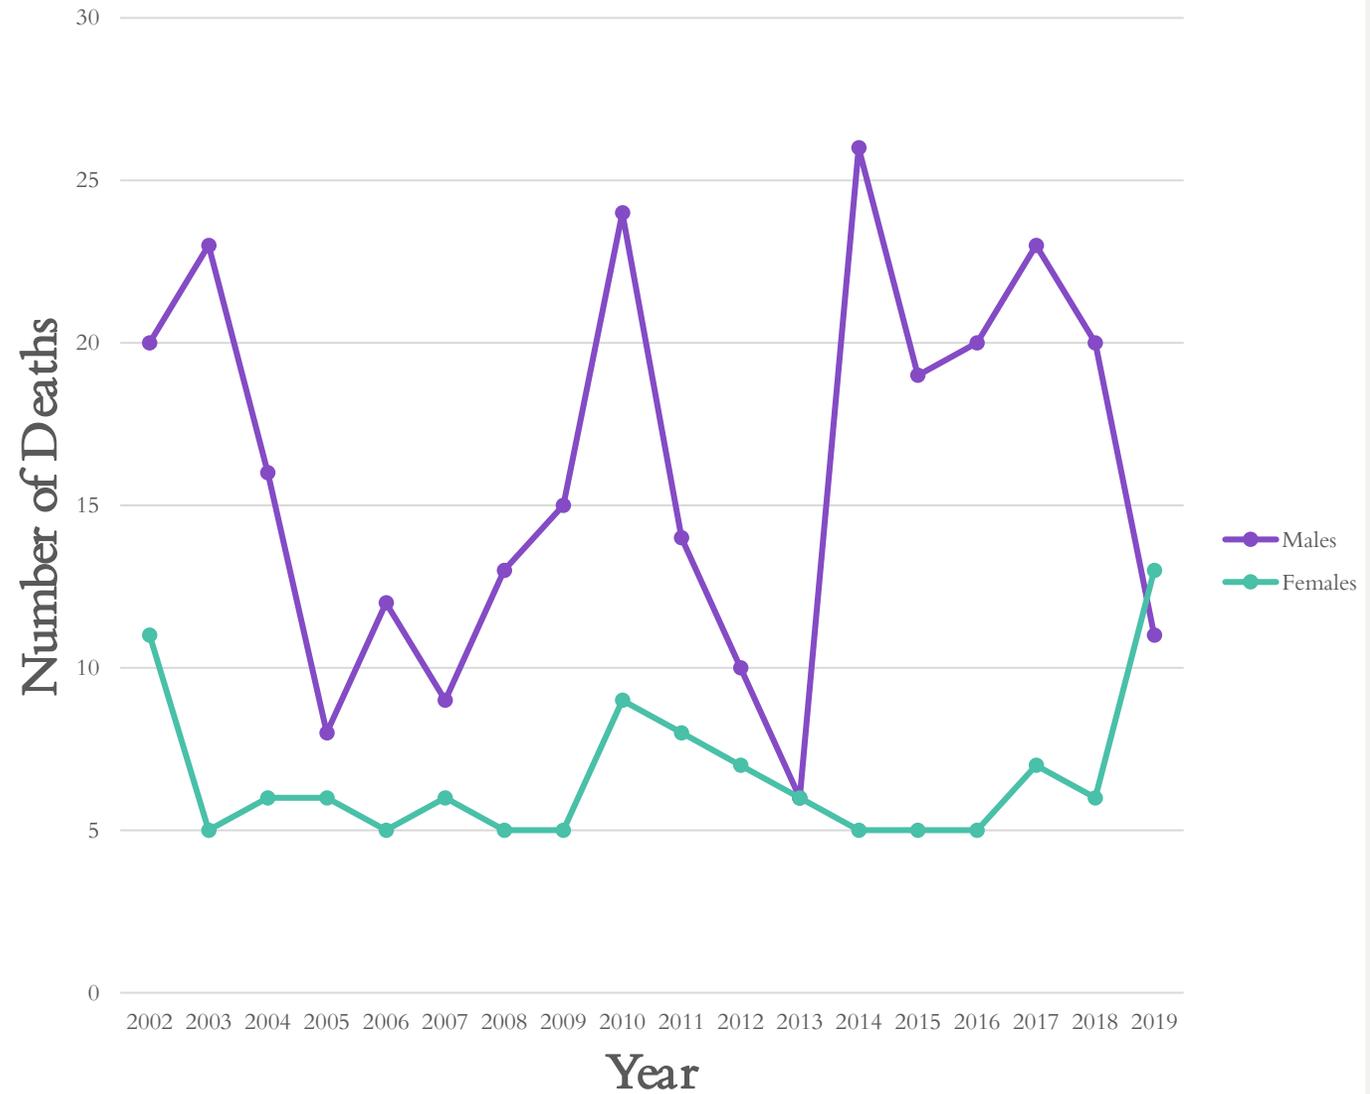

Females are more likely to report self-harm than males (8.9% vs. 4.6%) in the previous year⁶

Why?

- Is it because males use more lethal methods and therefore, they more likely have to be hospitalized?
- Are the rates of hospitalization due to self-harm in males decreasing due to them using different means not covered here?
- Is the decrease due to an increase in suicides in male adolescents?

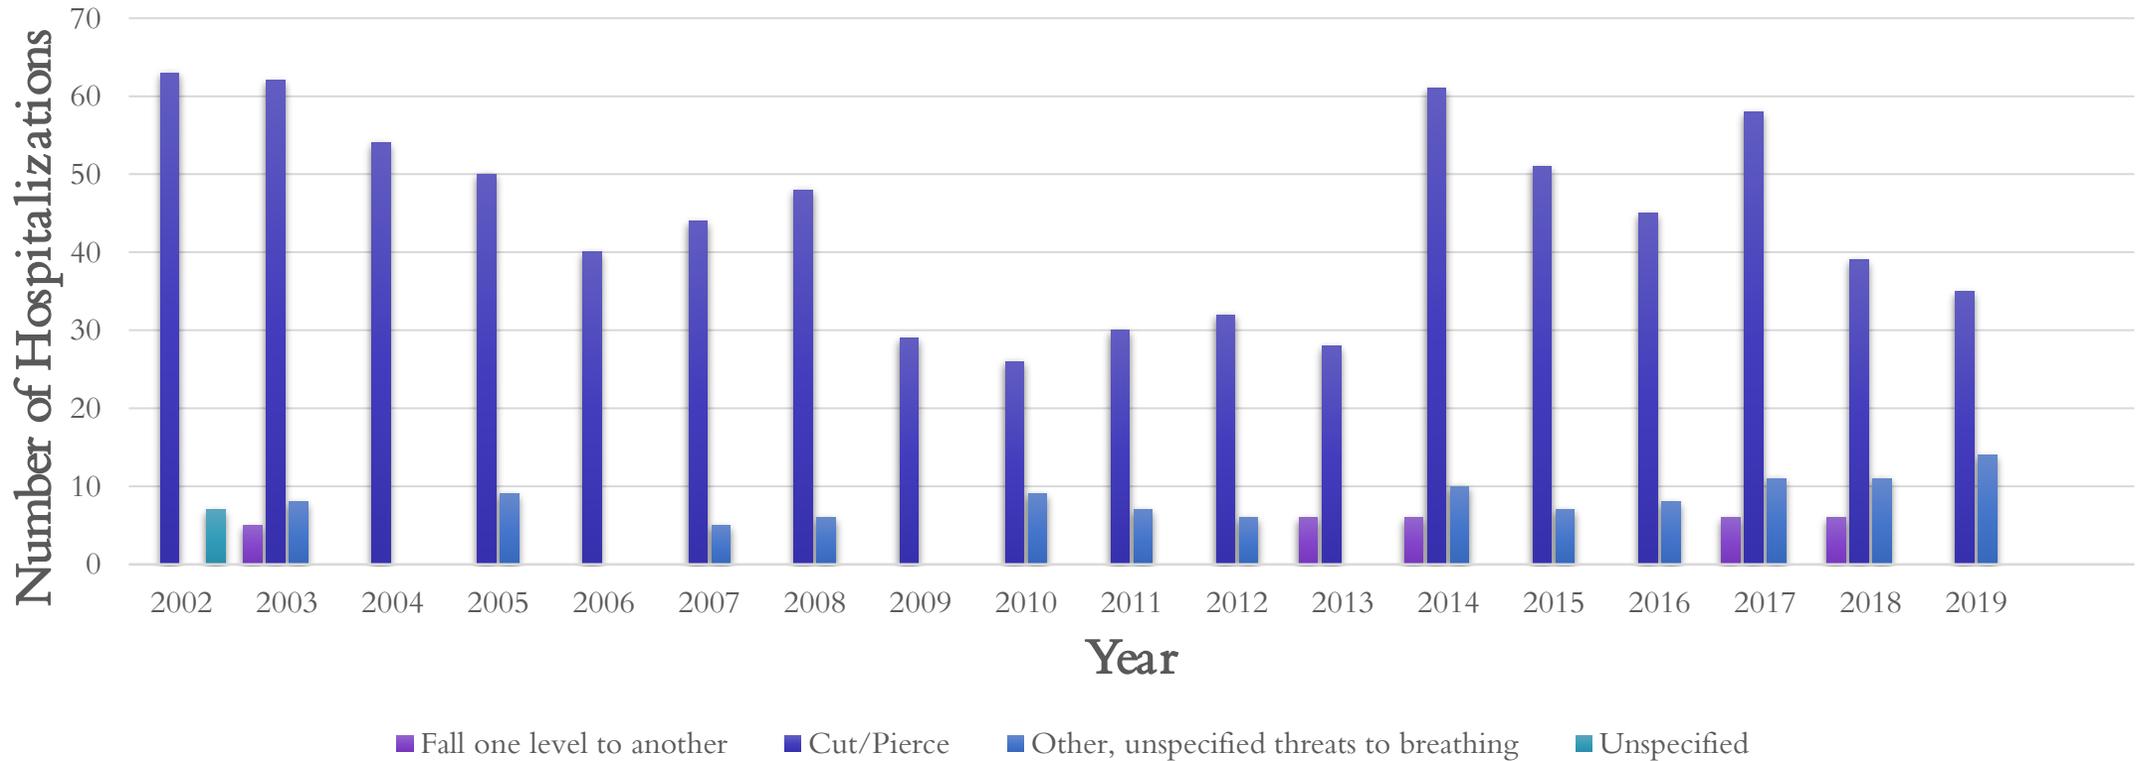

Death by Year and Sex

There did not appear to be any correlation between rates of hospitalization and rates of death

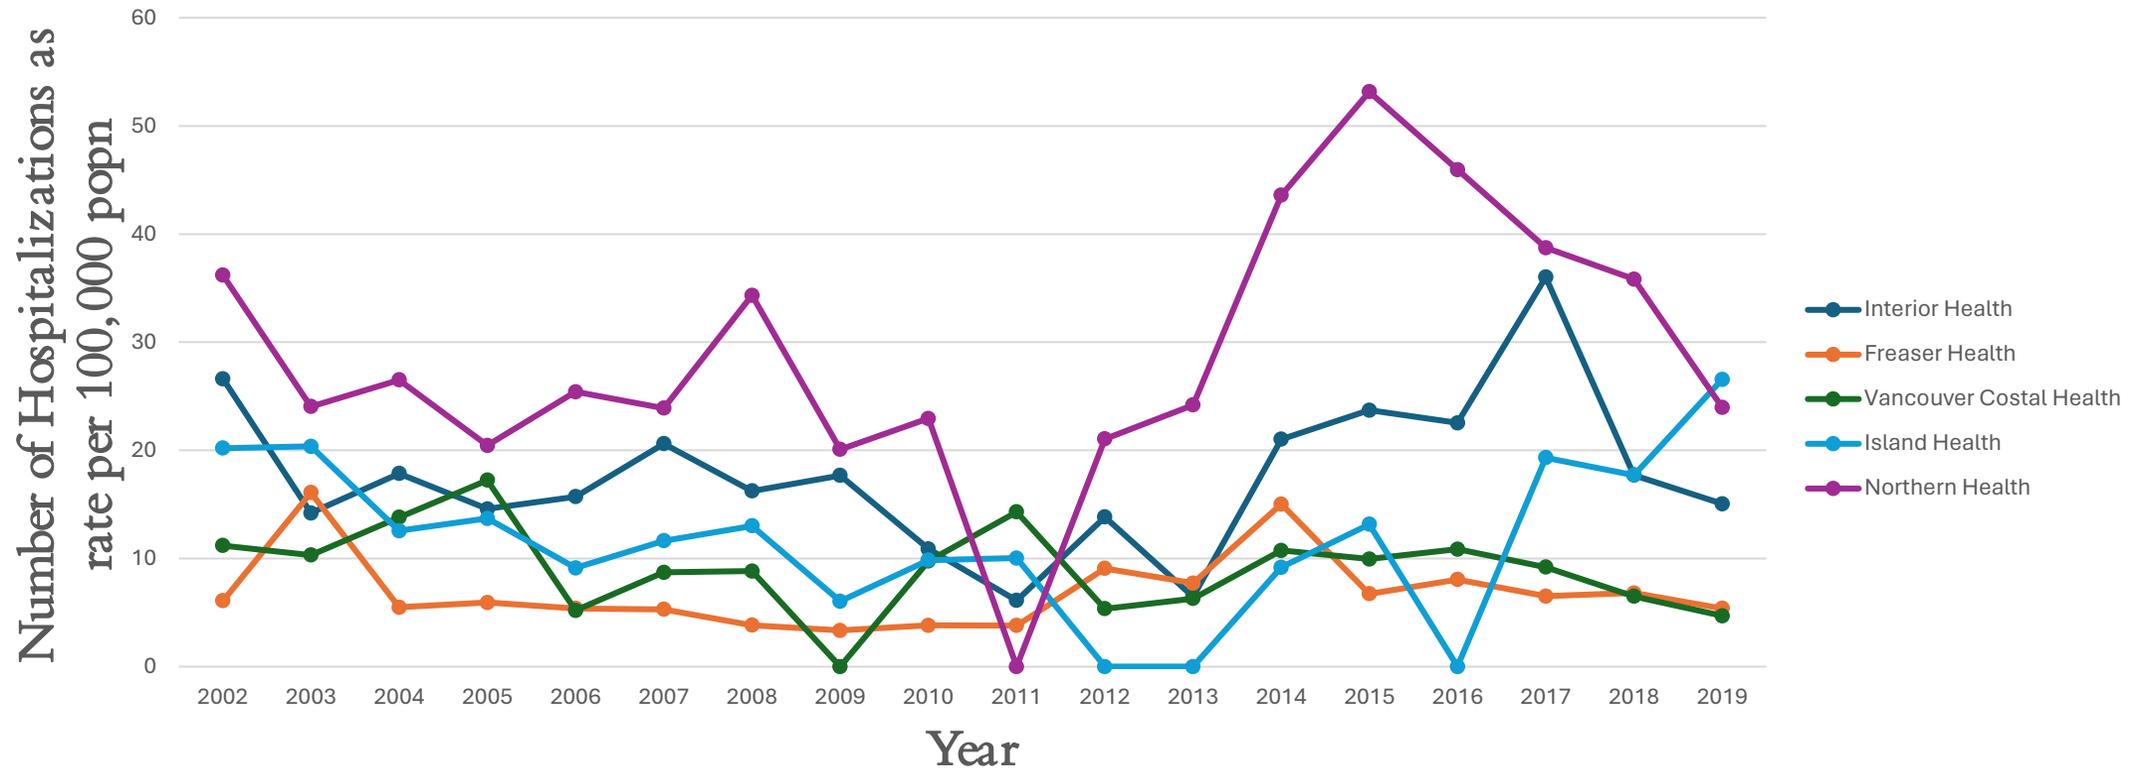

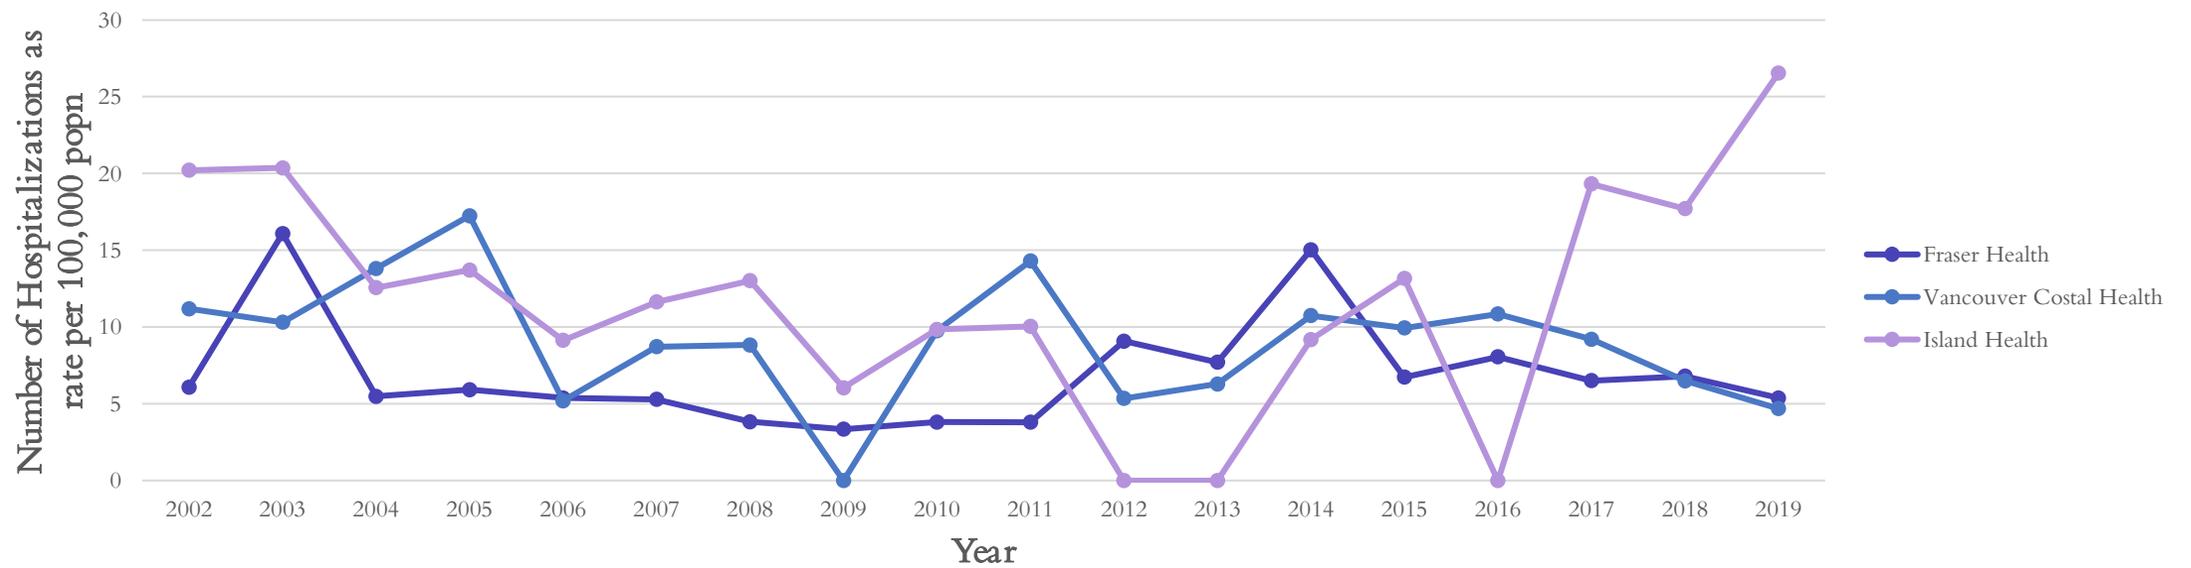

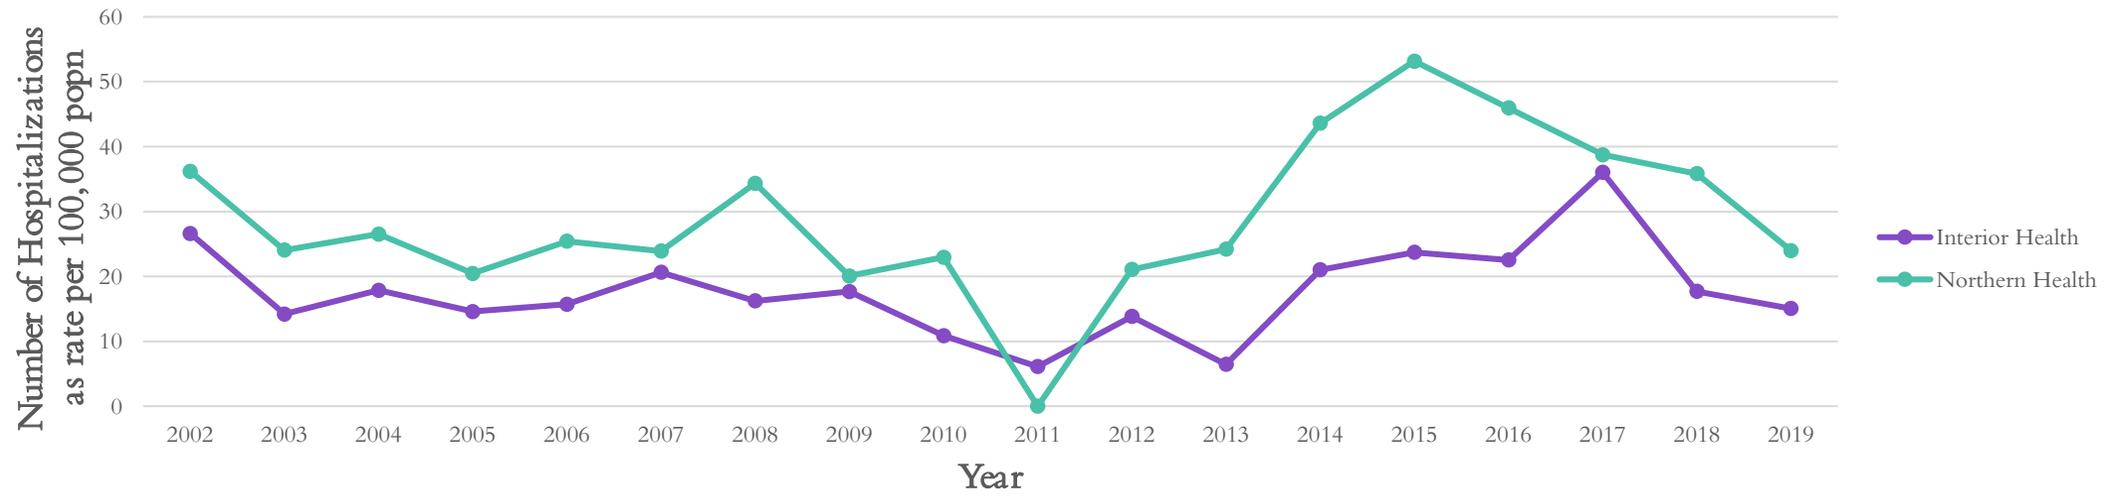

Hospitalization for Year by Cause of Injury

- Cut/pierce was found to be the most common cause of self-harm

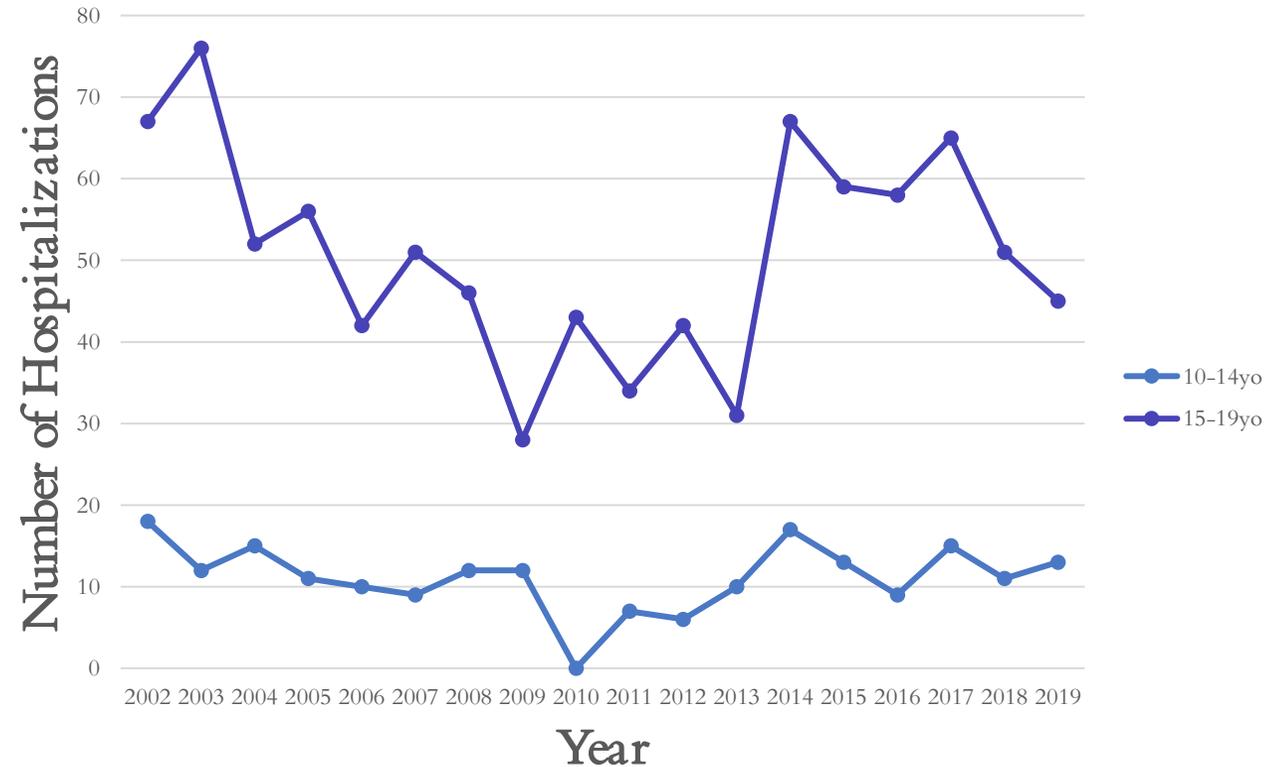

Hospitalization for Year by Region

Hospitalization for Year by Age Group

As expected, higher rates of self-harm were observed in the middle-late adolescent group compared to the early adolescent group

Limitations

Determination of self-harm vs intent to end life was based on healthcare providers assessment

Not just hospital presentations/ED visits as this data for the province was not readily available

Themes

Rates of hospitalization due to self-harm in adolescents in BC appear to be higher in males than females

Rates of hospitalizations due to self-harm appear to be higher in middle to late adolescents compared to early adolescents

Rates of hospitalization due to self-harm appear to be higher in the Northern and Interior Health Authorities

Future Implications

- Post COVID19 trends of hospitalizations are being collected and not yet available
- Availability of mental health services pre and post COVID and compare this to the trends of hospitalizations
- Does the method of self-harm impact duration of stay in hospital?

Preventing Accessibility to Self-Harm Methods

- Self-harm is highly taxing both economically and socially
- Restricting access to means of self-harm at provincial level
- Systematic review in 2005 by Mann and colleagues examined evidence from suicide prevention research.
 - This review concluded that the most promising interventions were detecting and treating mental illness, [restricting access to means](#), and gatekeeper education

Thank You

Background

Background

Purpose

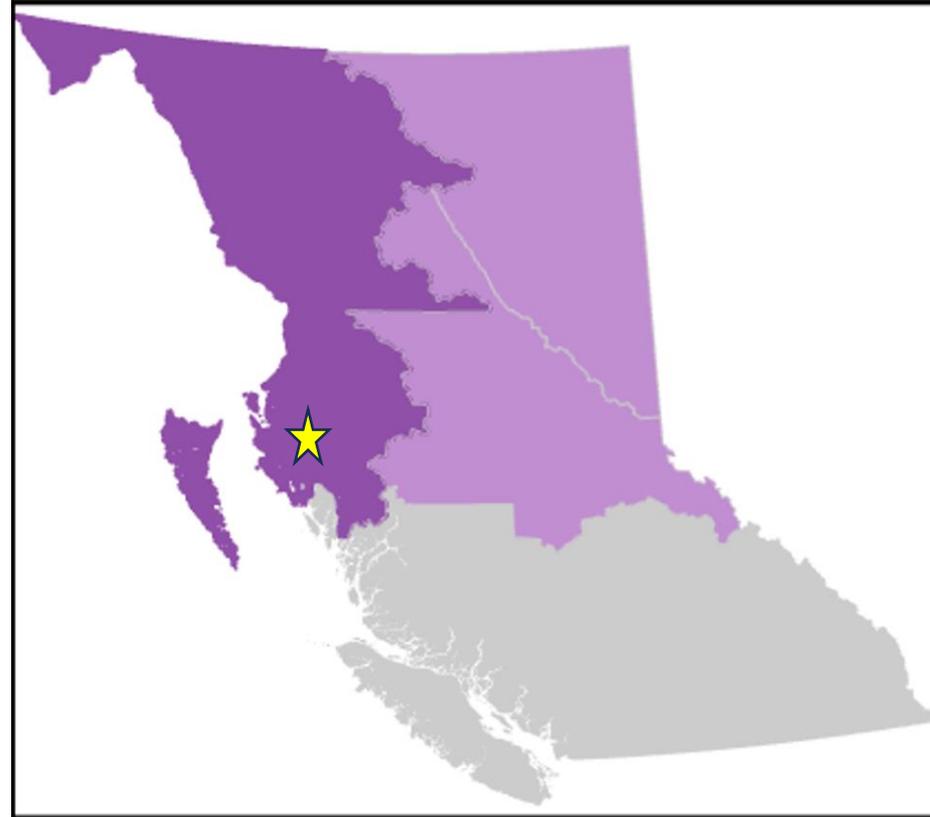

Methods

Results

Take Aways

Acknowledgments

Questions

September 2020 saw an unforeseen shortage of pediatricians in Terrace

- In response, a local community leader proposed that CHARLiE's virtual consultants fill gaps in the on-call schedule when no local pediatrician was available
- Between Sept 2020 - Dec 2022, CHARLiE assumed up to 50% of the pediatric on-call schedule

This the first virtual pediatric service in Canada to be introduced into the local on-call schedule in lieu of adequate local pediatrician coverage

Questions

Survey Results

The majority of CHARLiE users were “satisfied” or “very satisfied” with:

- Overall support (96.1%)
- Collegiality and professionalism (96.1%)
- User friendliness (94.2%)
- Provision of culturally-safe care (90.7%)
- Efficiency (90.4%)
- Assessment of patients (90.4%)

Fewer participants were “satisfied” or “very satisfied” with:

- Knowledge of local healthcare resources (75%)
- Guidance for procedural skills (55.7%)

Of the respondents who had not used CHARLiE, the most frequently reported barrier was lack of necessary resources to access the service within the workplace (54.5%)

Questions

4 themes emerged:

1. Efficiency, collegiality and professionalism
2. Improved access to general pediatric and subspecialty care
3. Preventing burnout for local pediatricians
4. Concerns with using CHARLiE

Focus Group Results

Background

Purpose

Methods

Results

Take Aways

Acknowledgments

Questions

Theme 1: Efficiency, collegiality and professionalism

CHARLiE pediatricians were reported to be rapidly available, courteous, helpful and receptive

“The [CHARLiE doctors] are always friendly”

“I was definitely treated like staff... I don't think anyone treated me any differently for being a resident... calling them definitely helped [me] take responsibility for my own patients.”

CHARLiE was reported to be helpful in managing indirect patient care tasks, such as arranging transport, which allowed care providers to remain at the bedside

“I get the pediatrician to call the Patient Transfer Network... CHARLiE is exceptional, they always do that”

Focus Group Results

Background

Purpose

Methods

Results

Take Aways

Acknowledgments

Questions

Theme 2: Improved access to general pediatric and subspecialty care

Virtual bedside consultation, whereby consultants “lay eyes” on patients and directly counsel families improved confidence for local healthcare providers, and was perceived to be helpful for families

“They take our concerns very seriously. I feel heard, the family feels heard, and often I use [the pediatrician] to communicate with the family where I’m not going to be able to do enough to help their concerns.”

“I’m sometimes absolutely amazed at what they managed, especially on the labour floor. They had a baby with meconium aspiration on CPAP, and the entire time they were supported by the CHARLiE pediatrician, and didn’t call me. I was absolutely floored with what they managed to do with CHARLiE’s support.”

Focus Group Results

Theme 3: Preventing burnout for local pediatricians

Background

“There's no comparison between before and after CHARLiE in terms of the number of times we were called when we were not on call... Now you have that freedom, you can go to the lake when you're not on call and not have that pressure the whole time. [Before CHARLiE], I couldn't go anywhere outside of cell service, even when I wasn't paid to be on call. I still had to be available for my community. It has been priceless to be able to say, I know that they'll be okay... I don't have to be available.”

Purpose

Methods

Results

Take Aways

“I don't think I would have been able to stay as a provider in in my community had it not been for CHARLiE”

Acknowledgments

Questions

However, there was concern that CHARLiE may curb efforts to recruit and retain local pediatricians

“When the model was proposed, it was proposed [as] a bridge... never a solution. And it's difficult because... when you offer a solution, even if it's temporary... it can be hard to remember that it's still an issue when it's no longer a crisis.”

Focus Group Results

Background

Purpose

Methods

Results

Take Aways

Acknowledgments

Questions

Theme 4: Concerns with using CHARLiE

Inconsistent WiFi access and the inability for a virtual consultant to provide hands-on patient care (e.g. perform examinations and procedures) were seen as major shortcomings

“The only setback with using CHARLiE is our internet connection... I lost connection and had to figure out another way to get through to the pediatrician that was on call that night”

“[CHARLiE] doesn’t replace the on-ground issues... for procedural skills... neonatal resuscitation, insertion of umbilical lines, and giving surfactant through an ET tube. It doesn’t matter who is guiding it, the risks tend to be too much [for non-pediatricians to perform the procedures].”

Focus Group Results

Background

Purpose

Methods

Results

Take Aways

Acknowledgments

Questions

Theme 4: Concerns with using CHARLiE

Participants noted lack of continuity among CHARLiE providers when managing children over the course of multiple days.

“You could call CHARLiE every day and get a different doc and review the whole case... that's one of the big negatives is that CHARLiE's very episodic.”

CHARLiE pediatricians were reported to have limited site-specific knowledge of healthcare resources (e.g. healthcare personnel, access to diagnostics)

“When we call CHARLiE it does take some explaining for them to understand where we're coming from... what our resources are, where we normally refer to...”

“...one of the CHARLiE docs says ‘well get your respiratory therapist’ and the person on the ground says ‘well there isn't one’”

Discussion

Participants valued CHARLiE's timely virtual assessments and benefitted from offloading indirect patient care tasks

Background

Purpose

Video-based consultation enhanced care provider confidence and perceived family/caregiver trust

Methods

Results

While providers from communities large enough to support local pediatricians naturally had a strong preference for consulting local, rather than virtual pediatricians, some providers from smaller communities preferred to consult CHARLiE, rather than obtain telephone advice from a pediatrician in a busy regional centre

Take Aways

Acknowledgments

Questions

Areas of improvement for CHARLiE included addressing technologic barriers, knowledge of local resources, access to documentation, and continuity of care

Conclusions

While maintaining a full complement of on-the-ground pediatricians remains the ultimate goal for larger communities in Northwestern BC, CHARLiE can bolster existing healthcare personnel **in times of crisis** to ensure **timely access to pediatric care** and **improve work-life sustainability for local pediatricians**

Background

Purpose

Methods

Results

Take Aways

Child Health Advice in Real Time Electronically

Pediatrics

Zoom: charlie1@rccbc.ca

Phone: 236-305-5352

Call CHARLIE  

Real-Time Virtual Support Child Health Advice in Real-time Electronically (CHARLIE) is free and friendly and available to physicians, residents, nurses, midwives, nurse practitioners and other providers.

Ask a question
Have a question about a neonatal, pediatric or teenage patient? Reach out anytime. CHARLIE is available 24/7.

Medication
Does your young patient need medication and you're not sure what dose to use? Consult with a CHARLIE Pediatrician for advice on medications.

Need a full consult?
When a pediatric patient presents at your rural site, you may want an immediate pediatric consult. CHARLIE Pediatricians are available via Zoom or — if you are at an RNPA nursing station — telehealth cart, to assist with this.

I want to call CHARLIE, what should I do?

- Ideally, start a video call over Zoom or arrange to have CHARLIE call into your telehealth cart if you have one.
- Have the patient's name, PPOV and DOB ready.

We're here for you
CHARLIE providers are passionate about providing pediatric care to rural, remote and Indigenous communities. Whether you are a nurse at a nursing station, midwife, nurse practitioner, resident or doctor serving a rural community, you are welcome to call.

Objectives

Objectives

Identify what **general pediatric topics** learners and staff perceive as being important to learn on an inpatient hospital pediatrics rotation.

Objectives

Identify what **general pediatric topics** learners and staff perceive as being important to learn on an inpatient hospital pediatrics rotation.

Discern preferred **learning modalities**.

Objectives

Identify what **general pediatric topics** learners and staff perceive as being important to learn on an inpatient hospital pediatrics rotation.

Discern preferred **learning modalities**.

Assess impact of new curriculum content.

Methods

Location:

BC Children's Hospital
Vancouver, Canada

Methods

Location:

BC Children's Hospital
Vancouver, Canada

Needs assessment:

- February 2023
- Residents, hospitalist fellows, CTU staff physicians

Surveyed regarding:

- a) Whether a curriculum was wanted
- b) Content (CPS and non-CPS)
- c) Delivery method
- d) Need for resources
- e) Curriculum structure

Methods

Location:

Quality Improvement

Why assess?

Likert scales from 1-5 on the following topics:

- Applicable to practice
- Enhanced understanding of this topic.
- Enhanced confidence in clinical management
- Sufficient quality of clarity, delivery, and content

Optional additional questions:

- What the learner liked
- Areas for improvement
- Other topics that the learner would like to see

Likert Question #1:

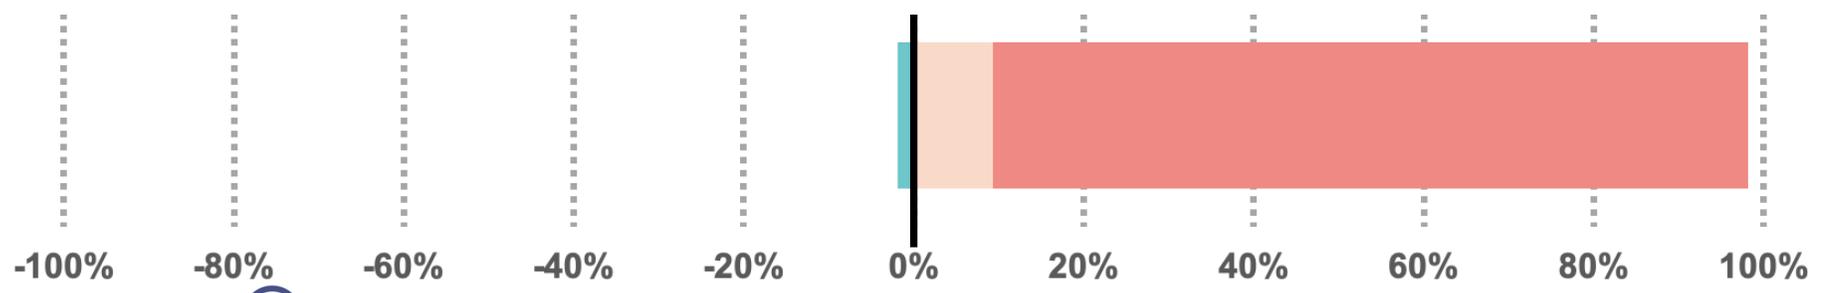

The topic presented represents something that the learner could encounter in practice.

Legend: ■ strongly disagree, ■ disagree, ■ neutral, ■ agree, ■ strongly agree

Mean +/- s.e.m

N=54

4.85 +/- 0.08

Likert Question #1:

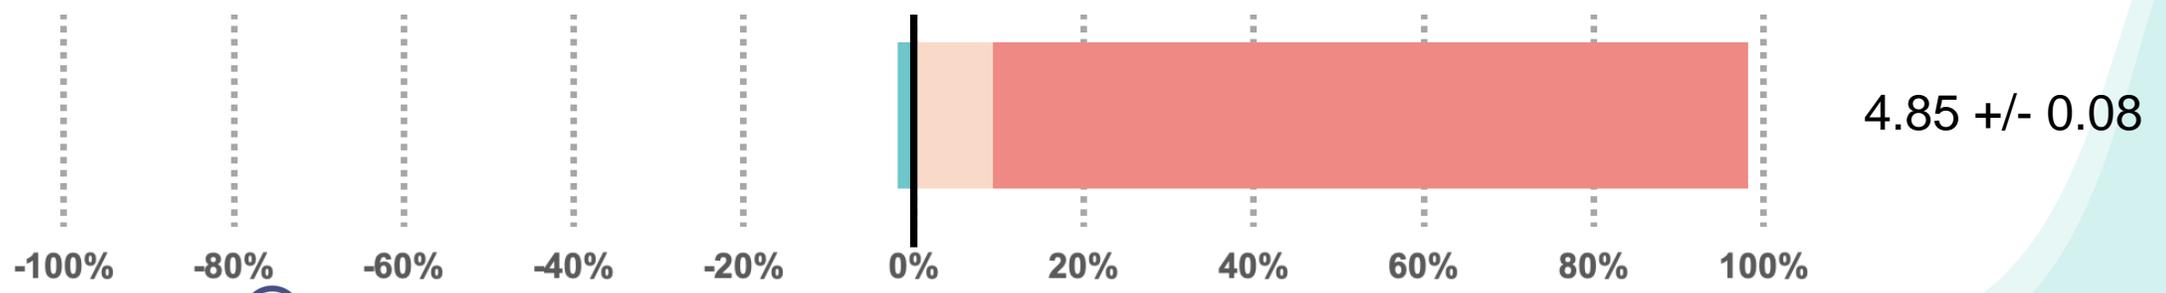

The topic presented represents something that the learner could encounter in practice.

Legend: ■ strongly disagree, ■ disagree, ■ neutral, ■ agree, ■ strongly agree

Mean +/- s.e.m

N=54

Likert Question #2:

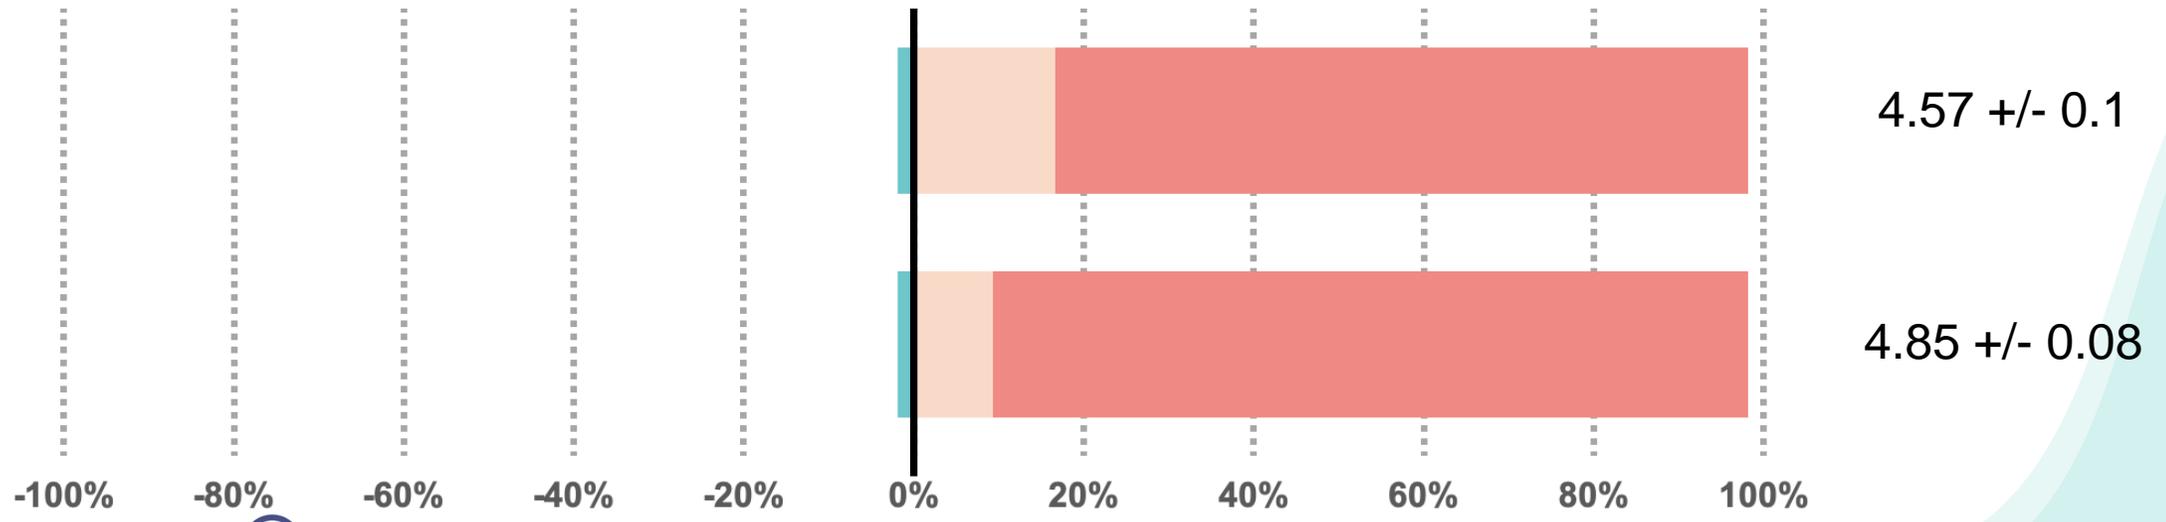

After this teaching the learner have a better understanding of this topic

Legend: ■ strongly disagree, ■ disagree, ■ neutral, ■ agree, ■ strongly agree

Mean +/- s.e.m

N=54

Likert Question #2:

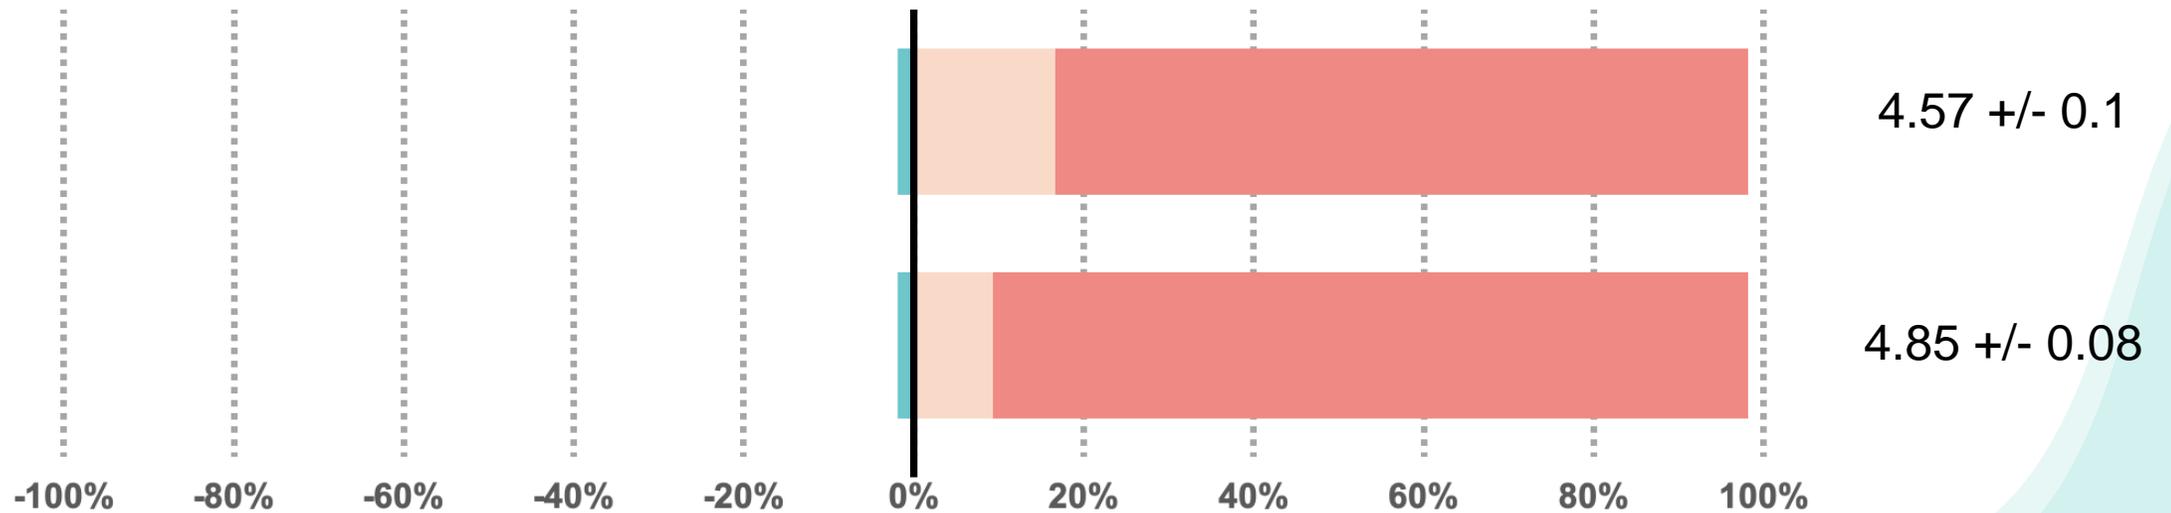

After this teaching the learner have a better understanding of this topic

Legend: ■ strongly disagree, ■ disagree, ■ neutral, ■ agree, ■ strongly agree

Mean +/- s.e.m

N=54

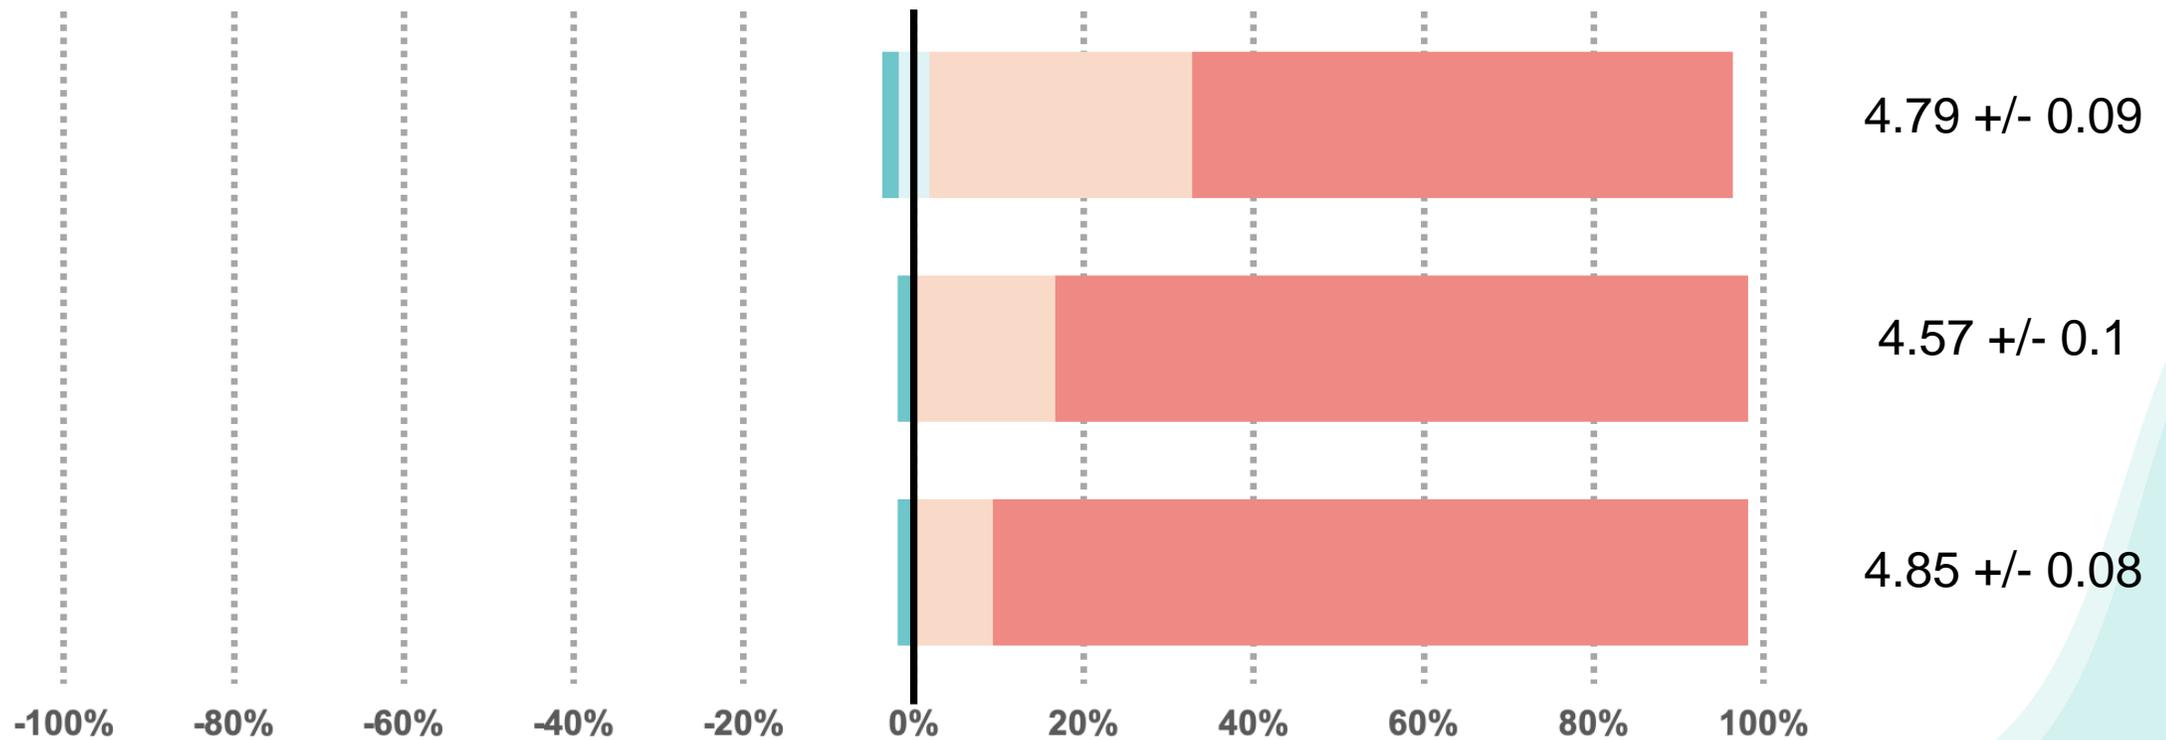

Likert Question #3:

After this teaching the learner feels more confident in being able to clinically manage this topic within their scope of their practice.

Legend: strongly disagree, disagree, neutral, agree, strongly agree

Mean +/- s.e.m

N=54

Likert Question #3:

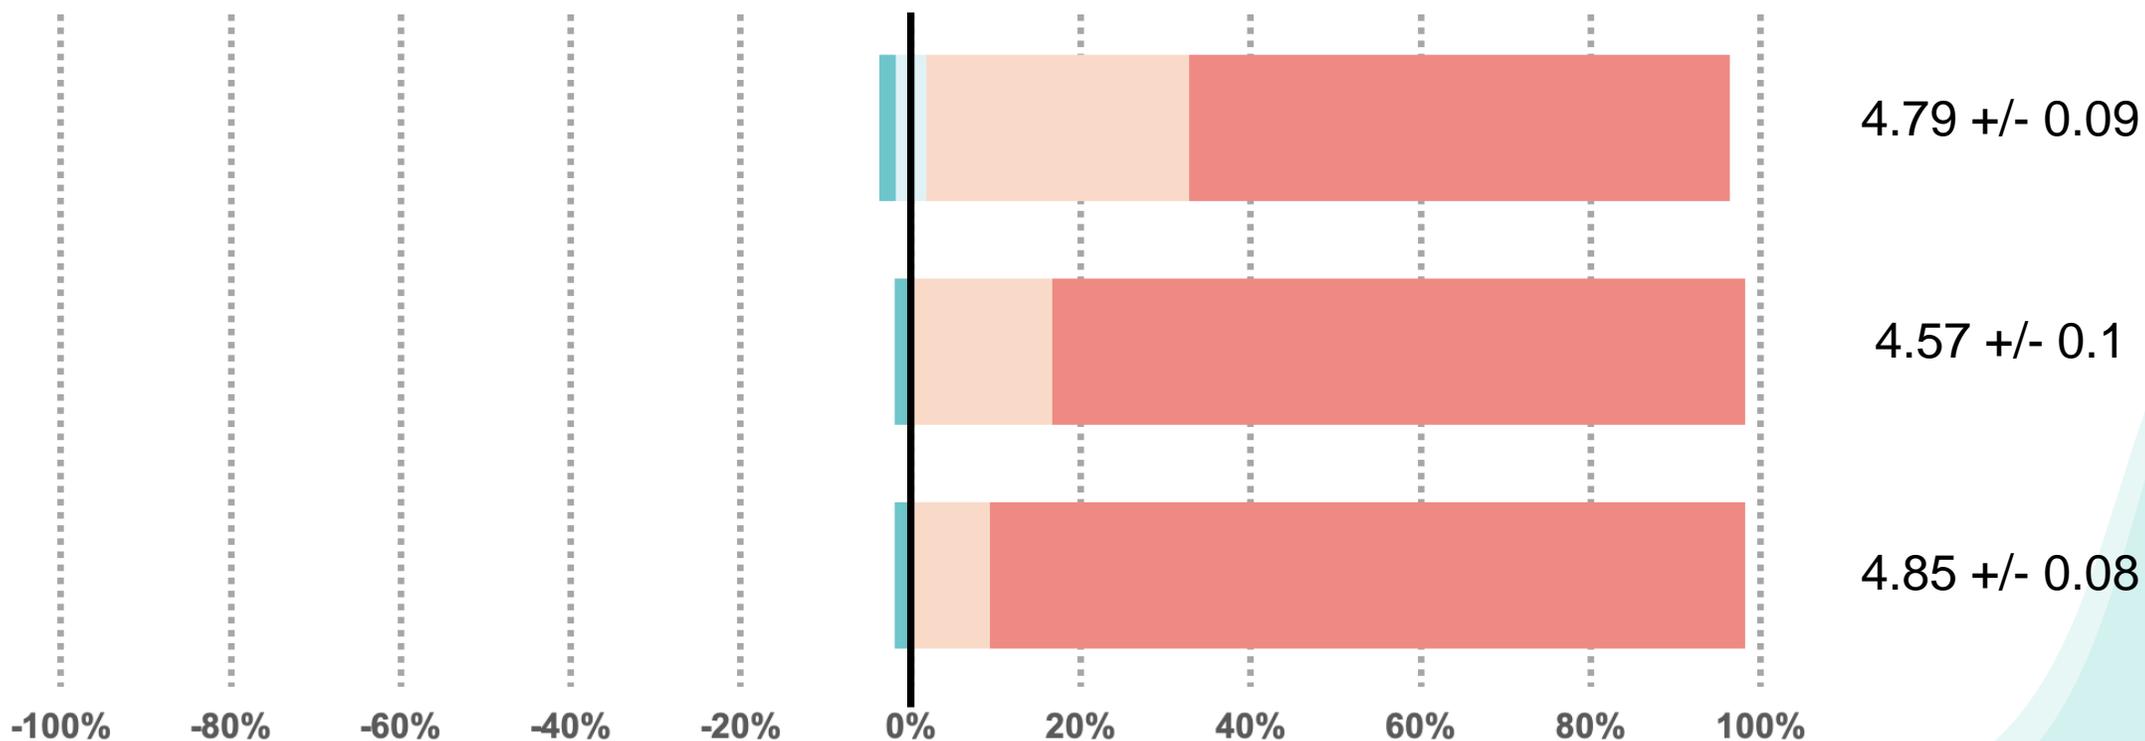

After this teaching the learner feels more confident in being able to clinically manage this topic within their scope of their practice.

Legend: ■ strongly disagree, ■ disagree, ■ neutral, ■ agree, ■ strongly agree

Mean +/- s.e.m

N=54

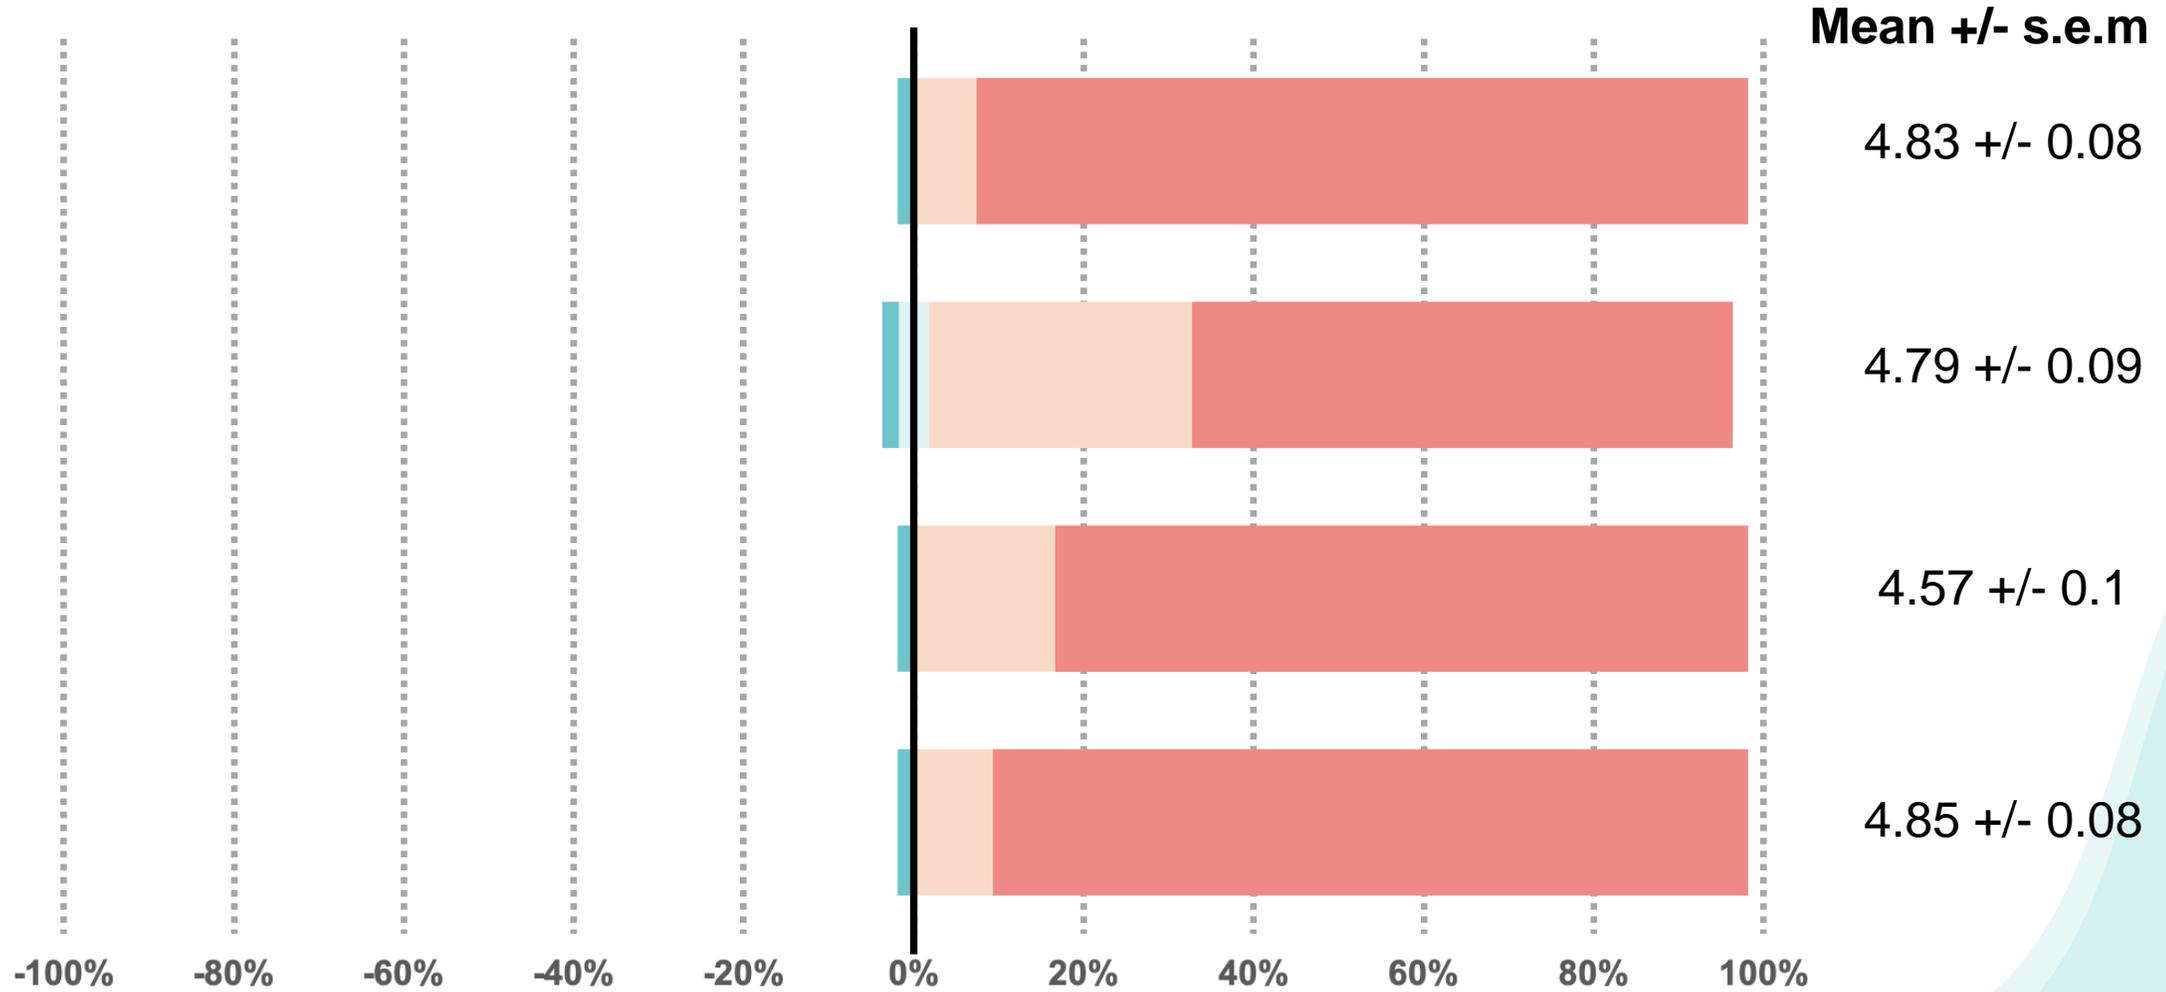

Likert Question #4:

The quality of the presentation was sufficient in clarity, delivery, and content.

Legend: ■ strongly disagree, ■ disagree, ■ neutral, ■ agree, ■ strongly agree

N=54

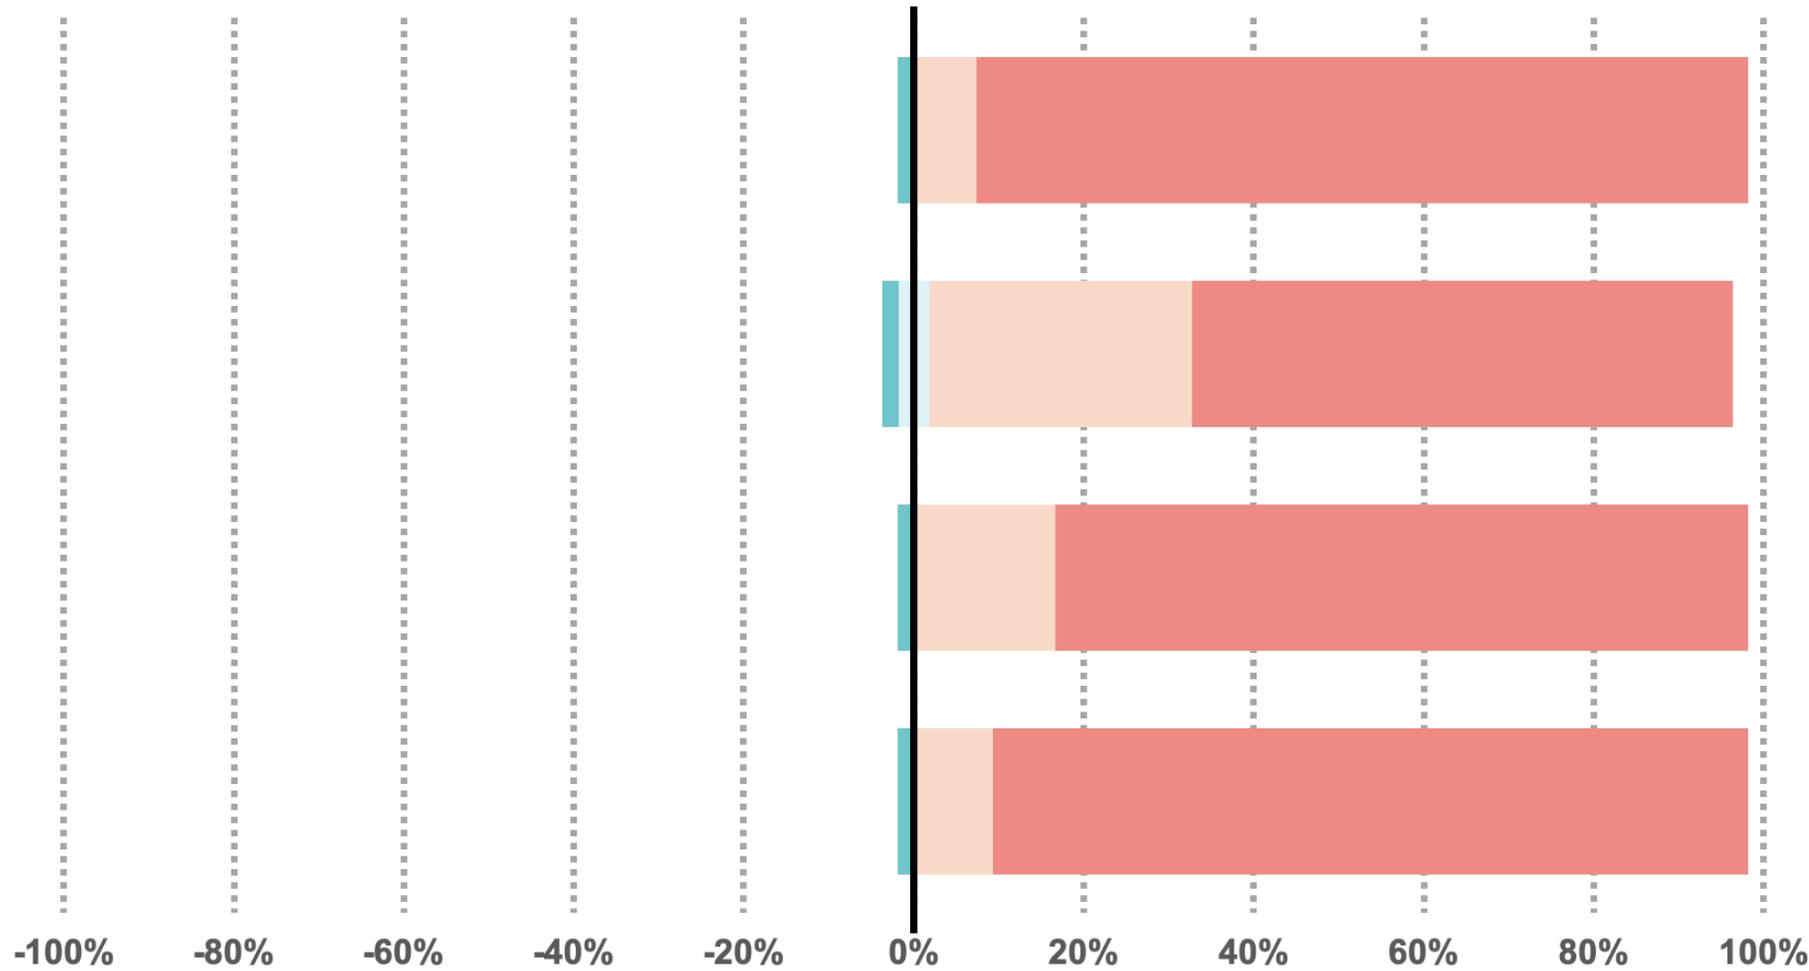

Likert Question #4:

The quality of the presentation was sufficient in clarity, delivery, and content.

Legend: ■ strongly disagree, ■ disagree, ■ neutral, ■ agree, ■ strongly agree

N=54

Mean +/- s.e.m

4.83 +/- 0.08

4.79 +/- 0.09

4.57 +/- 0.1

4.85 +/- 0.08

SUMMARY

Introduction

Celebrate Research Day 2024

Dr. Courtney Leach

Impact of Public Coverage on Access to Continuous Glucose Monitoring Systems in the Canadian Province of British Columbia

Courtney Leach MD¹, Jeffrey Bone PhD², Ananta Addala MD³, Shazhan Amed MD¹

¹UBC Department of Pediatrics, ²BC Children's Hospital Research Institute, ³Stanford School of Medicine

Disclosures

- No conflicts of interest to disclose.

Introduction

- Studies globally have shown an association between structural inequities in pediatric diabetes care and poorer diabetes outcomes such as hemoglobin A1C (A1C) and time in range (TIR) ¹⁻⁴
- Diabetes technology, such as continuous glucose monitoring (CGM) and insulin pumps, have the potential to partially mediate this effect⁵
- However, multiple barriers including cost and social determinants of health have impeded uptake of diabetes technology, particularly in marginalized populations²
- In BC, universal coverage of insulin pumps was implemented in 2008, however the impact of this policy on pump uptake was not formally evaluated

Introduction

- In June 2021, public coverage of the Dexcom CGM was introduced in BC for all individuals living with insulin dependent diabetes
- Previous research has shown that public funding of diabetes technology only partially closes inequity gaps in diabetes technology uptake⁶
- Therefore, it is essential to evaluate the impact of public policies such as universal coverage of diabetes technology

Study Objective

Objective: To describe differences in diabetes outcomes (i.e., A1C, TIR, and insulin pump use) and the impact of universal CGM coverage on CGM uptake across different levels of deprivation in children living with type 1 diabetes in BC, Canada.

Hypothesis: Differences will exist by deprivation index in diabetes outcomes, as well as CGM uptake before and after universal coverage.

Research Design and Methods: Data Source and Population

- **Data Source:** BC Pediatric Diabetes Registry (BC-PDR)
 - Socio-demographic and health data for consenting patients accessing care at the BC Children's Hospital (BCCH) Diabetes Clinic (80% consent rate)
 - Patient-level and visit-level data from time of enrolment to transition to adult care
- **Inclusion Criteria:** Patients with at least one visit after June 10, 2020
- **Exclusion Criteria:** Patients with a diagnosis of non-type 1 diabetes, or whose postal code was not available in dataset

The Canadian Index of Multiple Deprivation (CIMD)

- An area-based, geographically derived index developed for use across Canada to approximate deprivation across 4 dimensions
- Using individual postal codes, CIMD is calculated by Dissemination Area (DA) and Census data is used to assign individuals to equally sized levels of deprivation*

1 = least deprived; 5 = most deprived

Residential Instability

Speaks to the tendency of neighbourhood inhabitants to fluctuate over time, taking into consideration both housing and familial characteristics.

Economic Dependency

Relates to reliance on the workforce, or a dependence on sources of income other than employment income.

Situational Vulnerability

Refers to variations in socio-demographic conditions in the areas of housing and education, while taking into account other demographic characteristics.

*Ethnocultural Composition, the fourth dimension in the CIMD, was ultimately not used, as due to regional demographics, the quintiles in this domain were felt to be an inaccurate approximation of SES.

Research Design and Methods

- The cohort was described using medians and interquartile ranges for continuous variables and counts and percentages for categorical variables
- A1C, TIR, and pump use were summarized graphically by quintile and analyzed via linear mixed effects models, adjusting for age and sex
- An interrupted time-series analysis was used to compare predicted trend in CGM use following funding implementation to the actual use observed, per deprivation quintile

Demographics and deprivation quintiles in study population

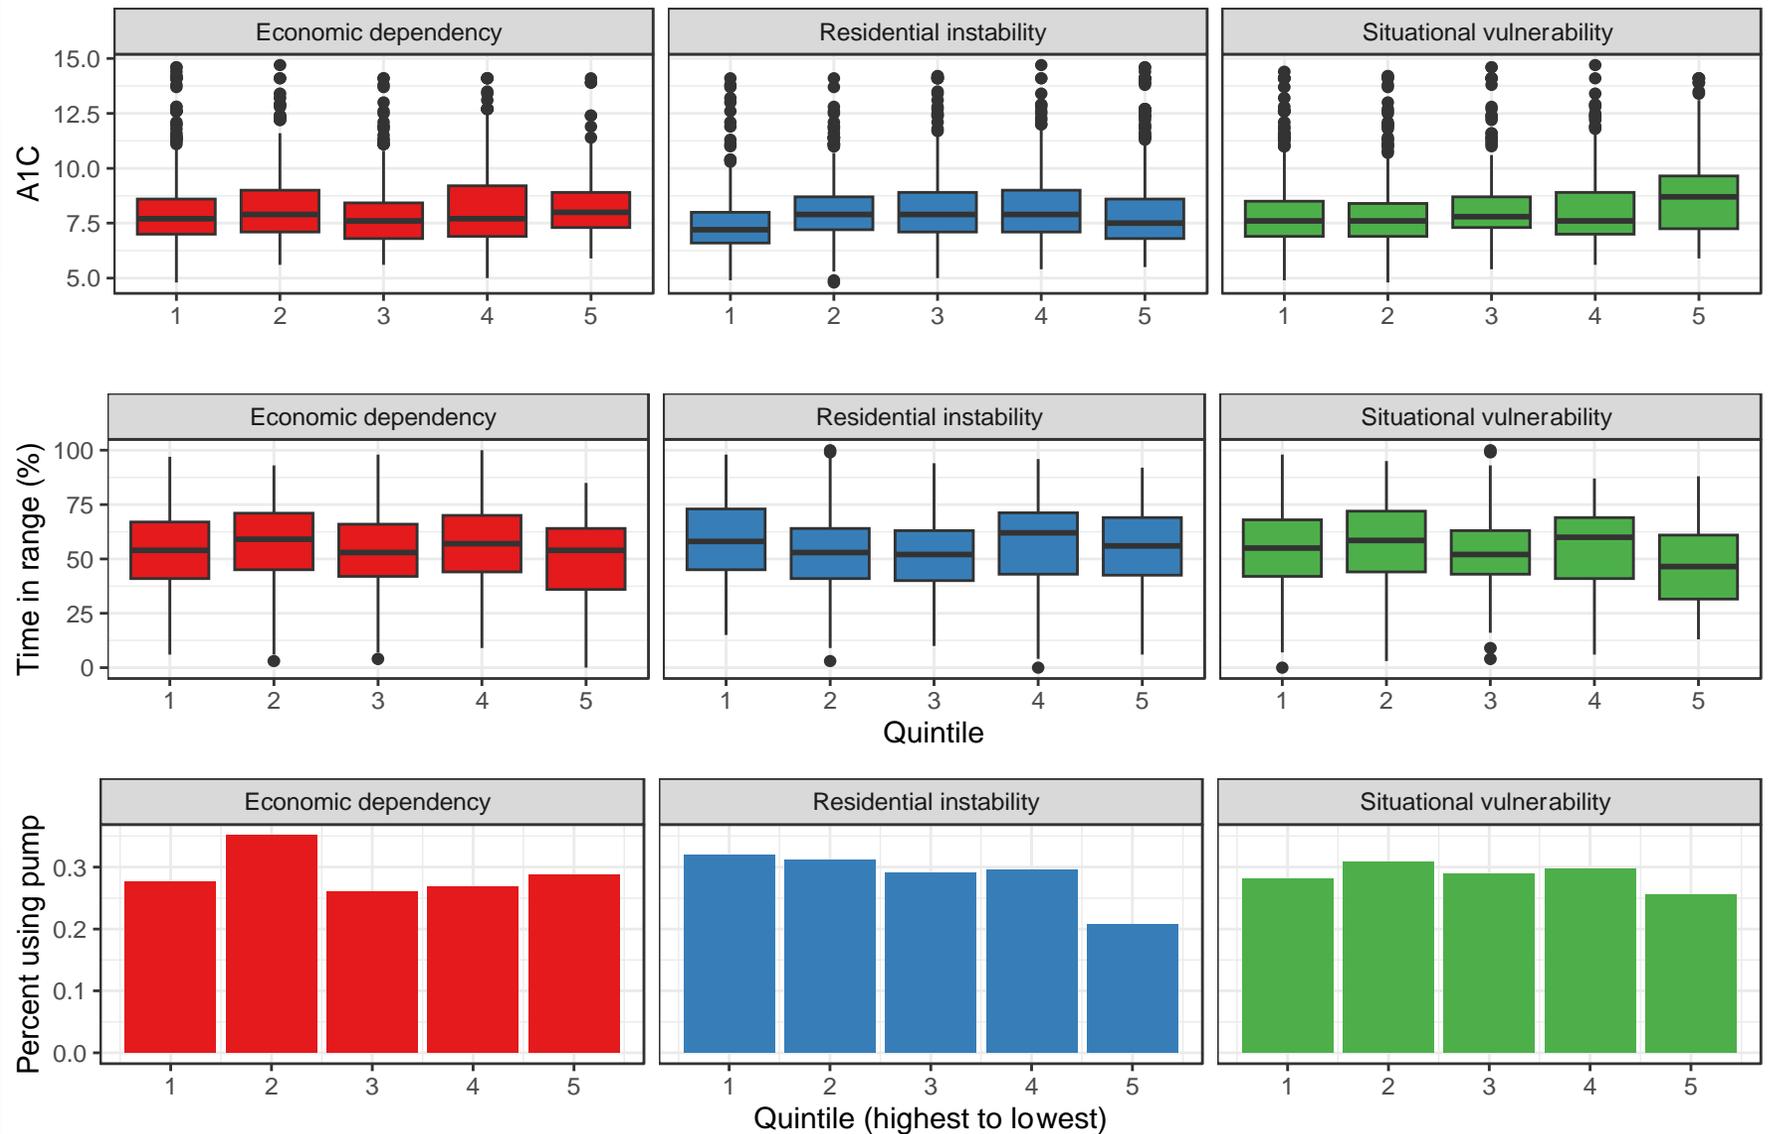

Baseline Demographics, N= 494

Gender Distribution (F/M)	213 (43.1%) / 281 (56.9%)
Median Age at Study Start (Years) [IQR]	13.4 [9.7, 16.3]
Median A1C at Diagnosis (%) [IQR]	11.7 [9.8, 13.8]
Median A1C at Study Start (%) [IQR]	7.9 [7.1, 8.6]

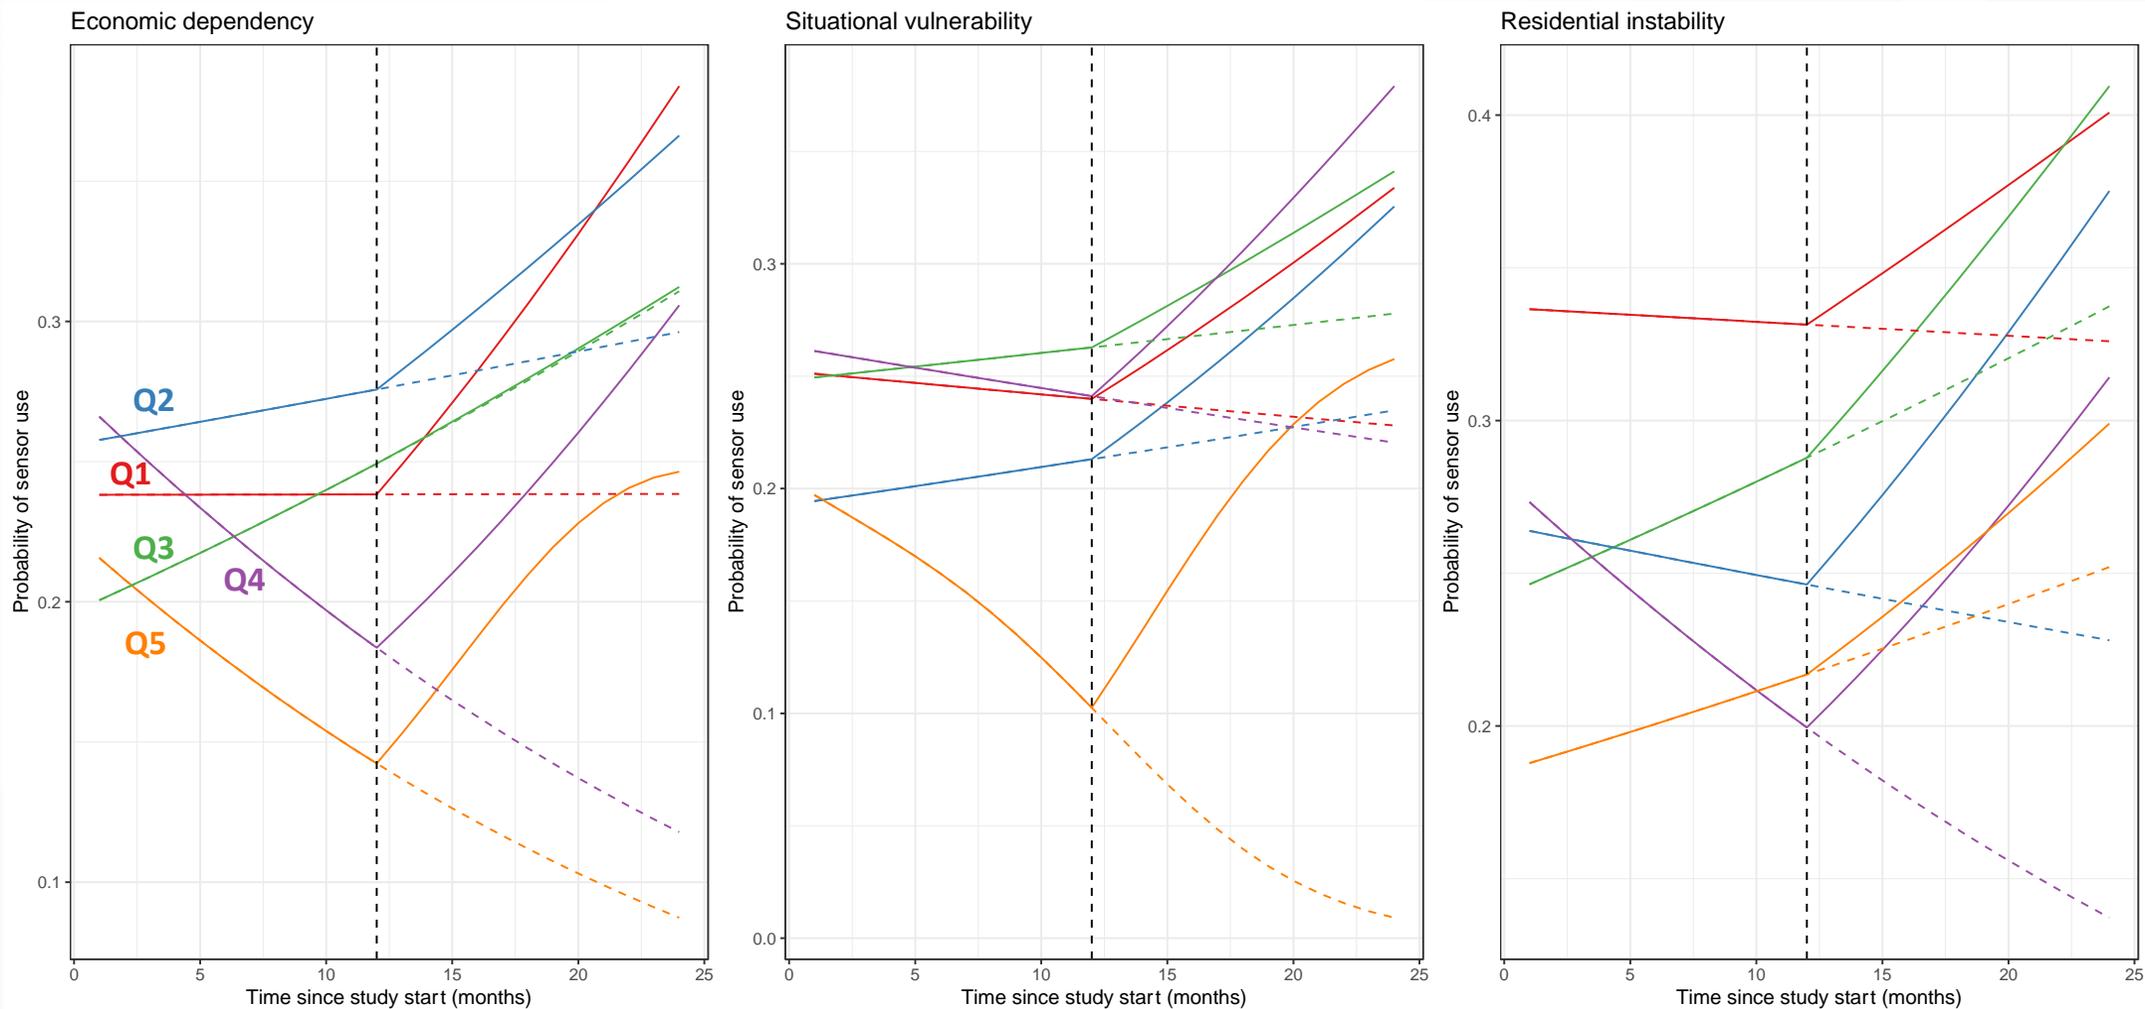

CIMD Quintile Distribution, by Dimension, Number (%)

	1	2	3	4	5
Residential Instability	74 (15)	132 (27)	120 (24)	98 (20)	70 (14)
Economic Dependency	158 (32)	107 (22)	98 (20)	75 (15)	56 (11)
Situational Vulnerability	173 (35)	120 (24)	90 (18)	78 (16)	33 (7)

There was no significant difference observed in A1C, TIR, or pump use across deprivation quintiles

Overall increase in CGM uptake one year following implementation of universal funding for CGM with the **greatest increase observed in the most deprived groups**

Comparison to Existing Literature

- In our study, although the greatest increase in CGM uptake was in the most deprived groups, differences in CGM use across indices of deprivation **did not completely disappear** after universal coverage was implemented
- In Australia, CGM uptake increased from 5% to 79% two years after universal CGM coverage however, an equity gap persisted between the least and most deprived groups 5 years later⁶
- In Germany, the equity gap between the least and most deprived groups disappeared 5 years after universal CGM coverage⁷

Strengths and Limitations

Strengths:

- Reasonably large sample size
- Diverse population

Limitations:

- Deprivation index quintiles are derived at the dissemination area (DA) level which may not accurately represent all individuals' deprivation
- BC-PDR includes patients accessing care at BC Children's Hospital (~40% of all children living with diabetes in BC), limiting the generalizability of our results
- Our study did not evaluate sustained use of CGM (i.e. for >1 year) by deprivation index

Conclusions & Next Steps

- Prior to universal CGM funding in BC, CGM uptake varied significantly by deprivation index, with the most deprived groups demonstrating lower uptake
- **Our study showed that the implementation of a universal CGM funding policy in the province of BC was effective in narrowing, but not closing, this equity gap**
- Our study demonstrates the impact of policy change and will inform future policy decisions as new diabetes technology becomes available
- Future studies will focus on assessing sustained diabetes technology use by deprivation index and will explore factors that might contribute to the residual equity gap in technology uptake

Acknowledgements

Thank you to my supervisors, Shazhan Amed and Jeffrey Bone, and co-authors, Crystal Ng and Ananta Addala, on this project.

Celebrate Research Day 2024

Dr. Lindsay Newman

The Incorporation of Entrustable Professional Activities into Simulation Curricula within Canadian Pediatric Residency Programs

Researchers:

Dr. Lindsay Newman PGY4

Dr. Mel Chan

Dr. Mia Remington

Outline

1. Background
2. Purpose
3. Methods
4. Results
5. Conclusions

Background

- Pediatrics launched CBD in 2021
- Move through stages via Entrustable Professional Activities (EPAs)
- Some EPAs can be completed in simulation (SBA of EPAs)...

Background

But how?

- Certain EPAs may be more amenable to SBA than others
- Need for increased resources
- Psychological effect on trainees

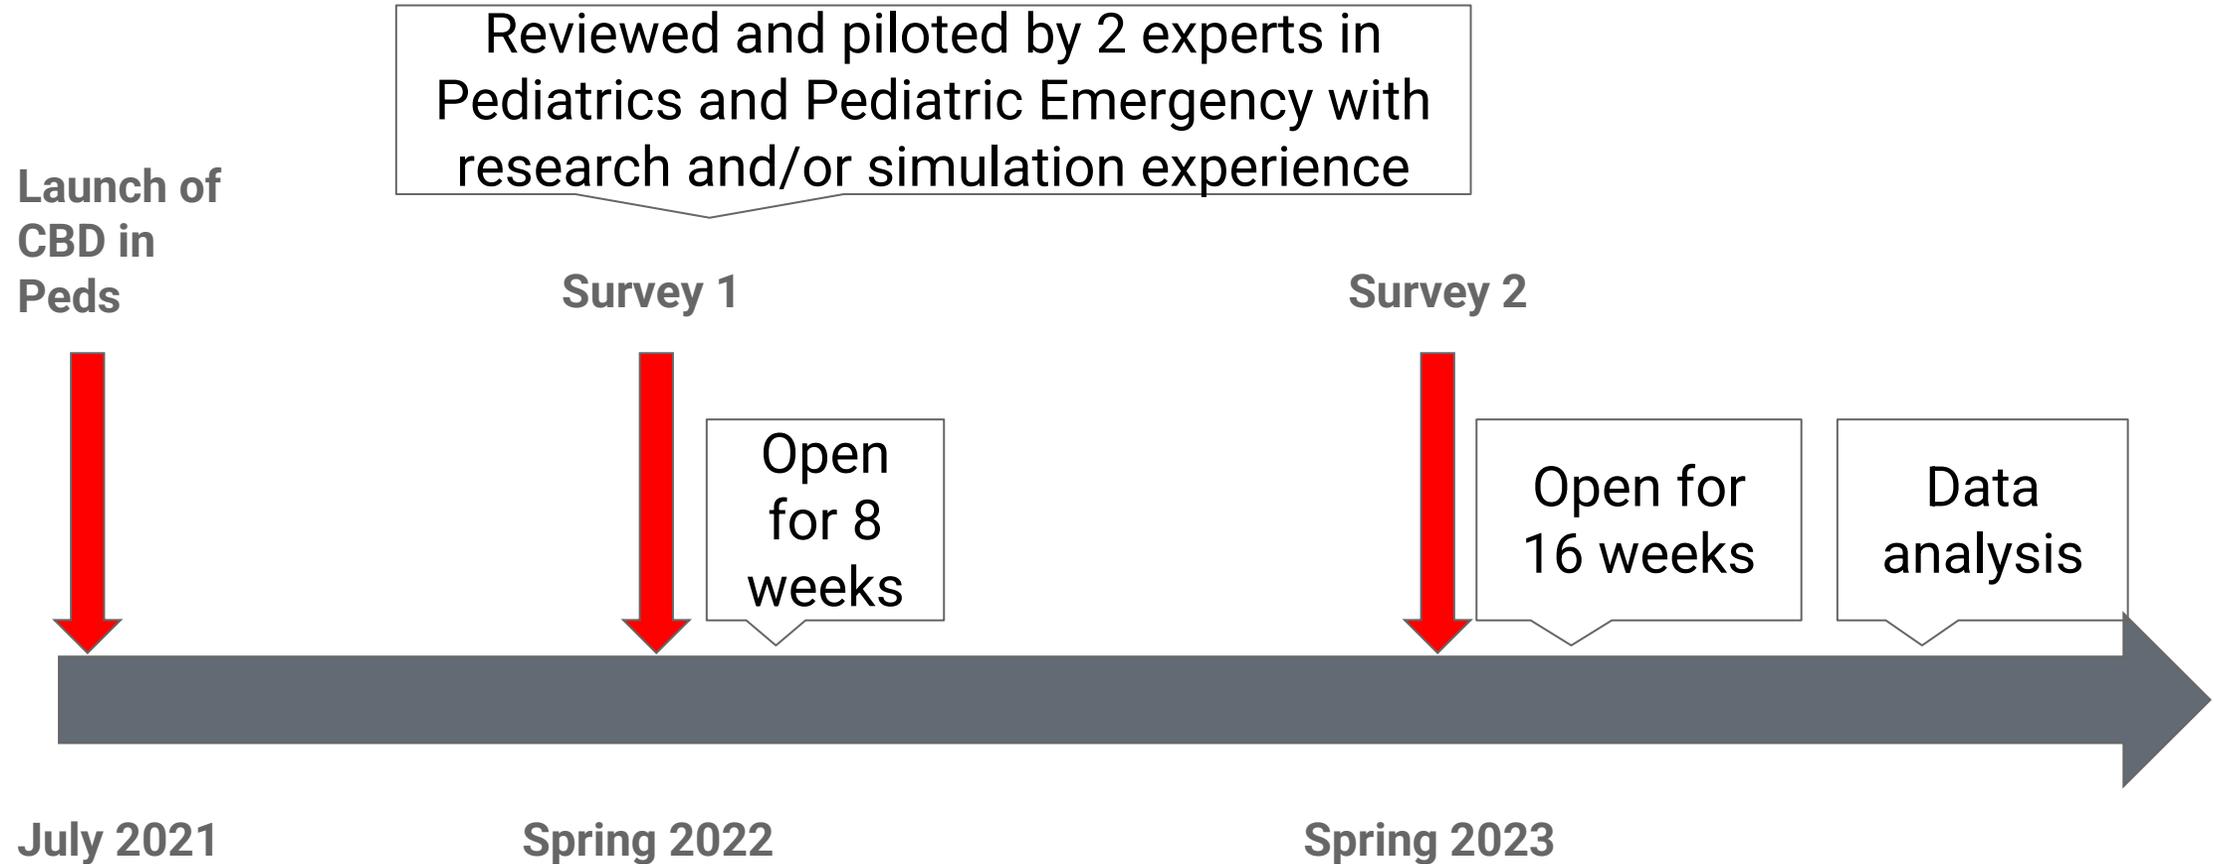

Study Purpose

To explore how Canadian pediatric residency programs planned to assess EPAs in simulation and to follow-up one year later to explore successes and barriers in this process

Methods

- REB approved
- Surveys emailed to PDs/simulation leads in all 17 programs
- Voluntary, anonymous participation
- Collection & management via REDCap

Methods

Results

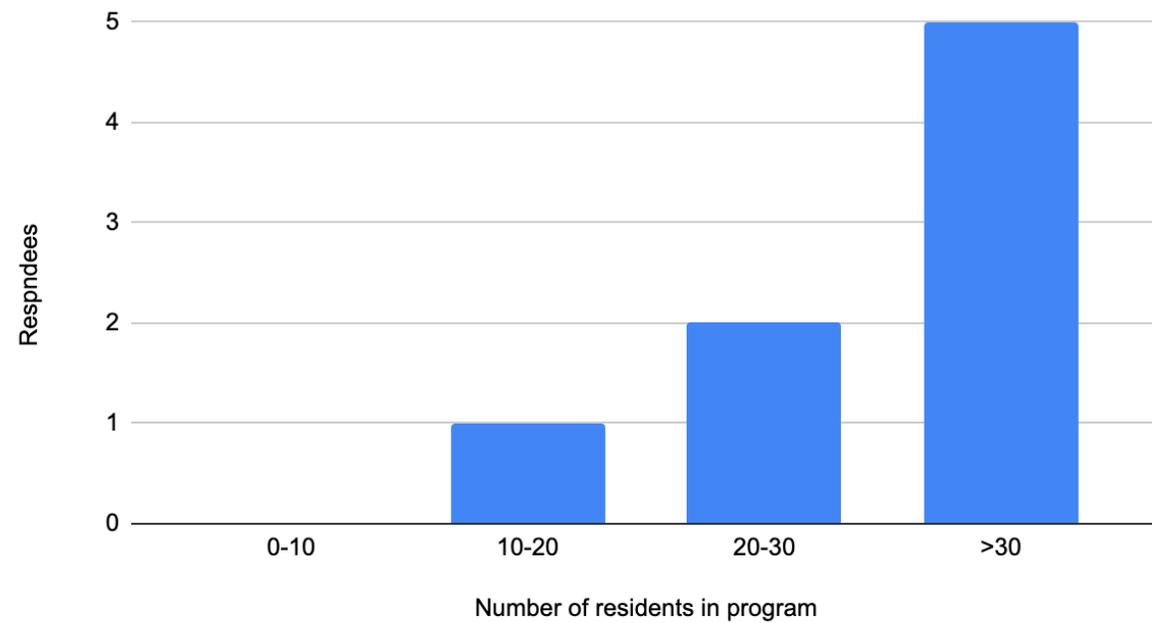

Survey 1

- Completed by 8/17 programs (47%)
 - 7/8 PD, 1/8 SL
- All had dedicated sim centre and peds sim curriculum

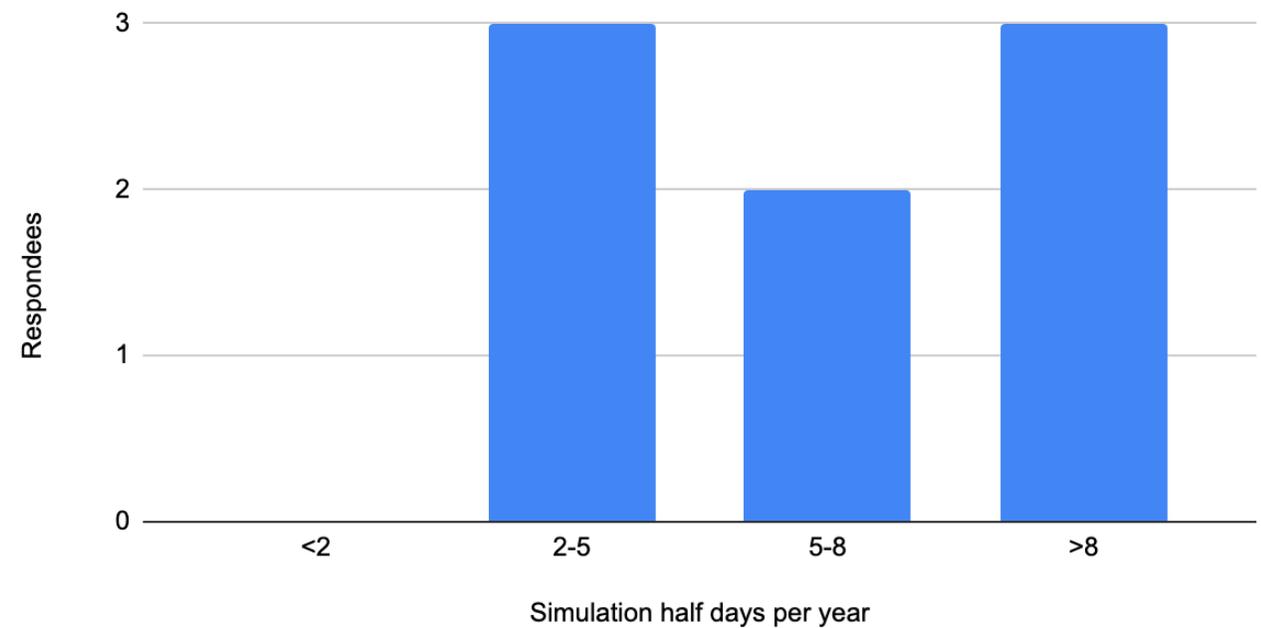

Results

Survey 1

How many residents are in your general pediatrics program?

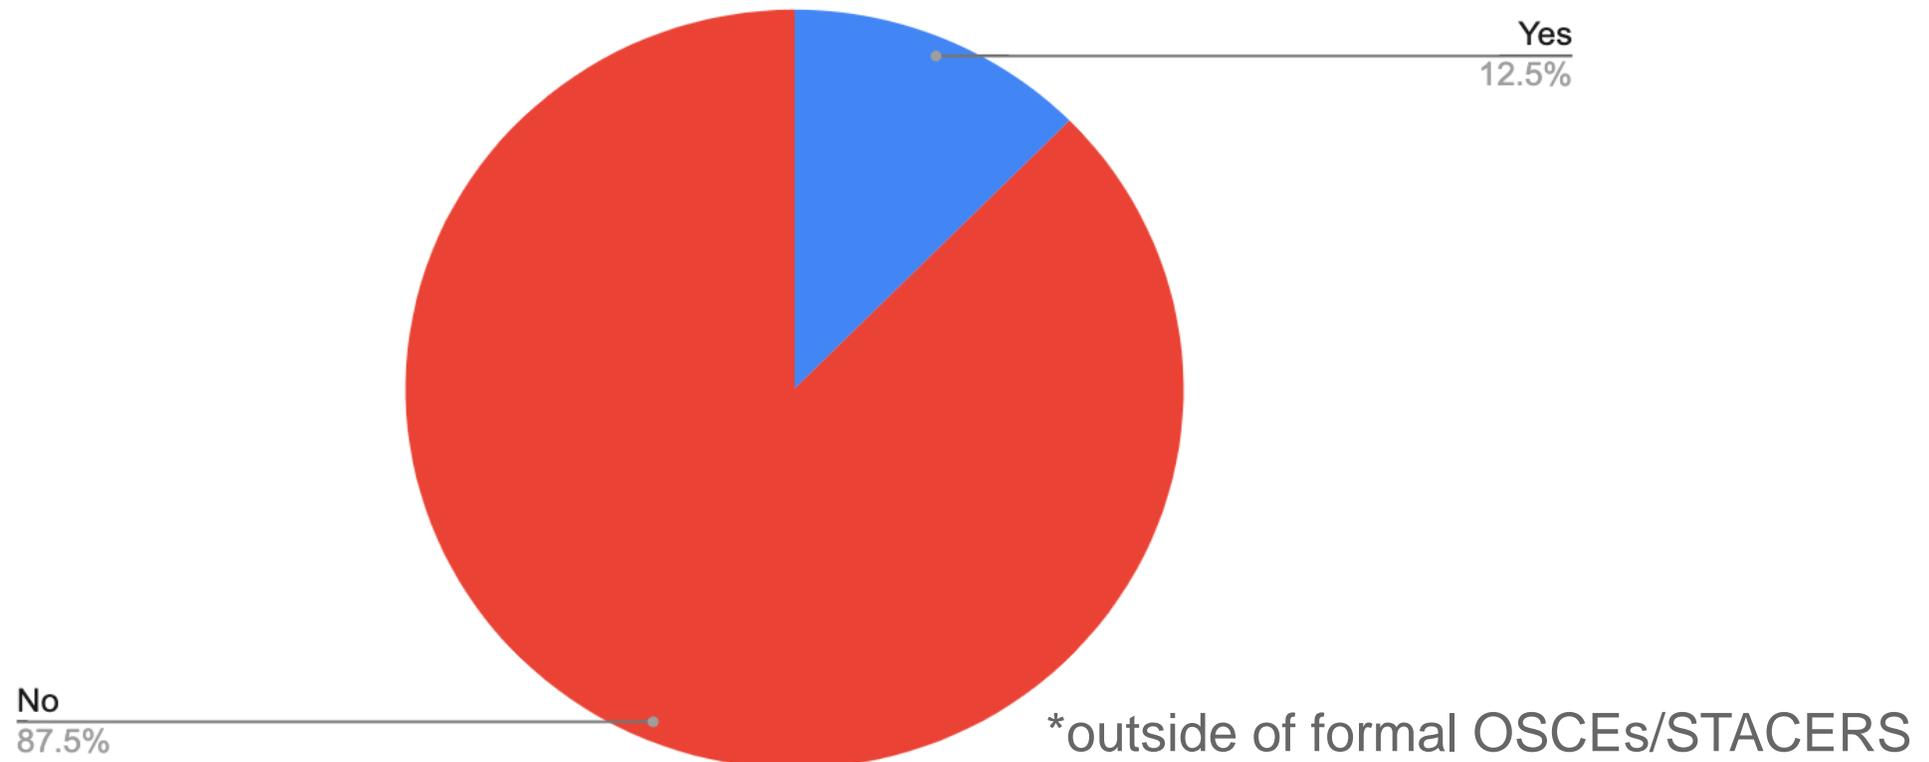

How many simulation half day sessions does each resident participate in per year?

Results

Survey 1

Prior to the launch of CBD, did you do formal assessments of resident performance within your simulation curriculum?*

Results

Survey 1

- With the launch of CBD, 100% were assessing or planning to assess EPAs in simulation!
- 7/8 planned to develop specific simulation sessions for dedicated EPA assessment

Results

Survey 1

- 5/8 planned to have a separate assessor present; all were undecided if they would provide specific assessor training
- All were either undecided (6/8) or decided against (2/8) the planned use of standardized patients

Results

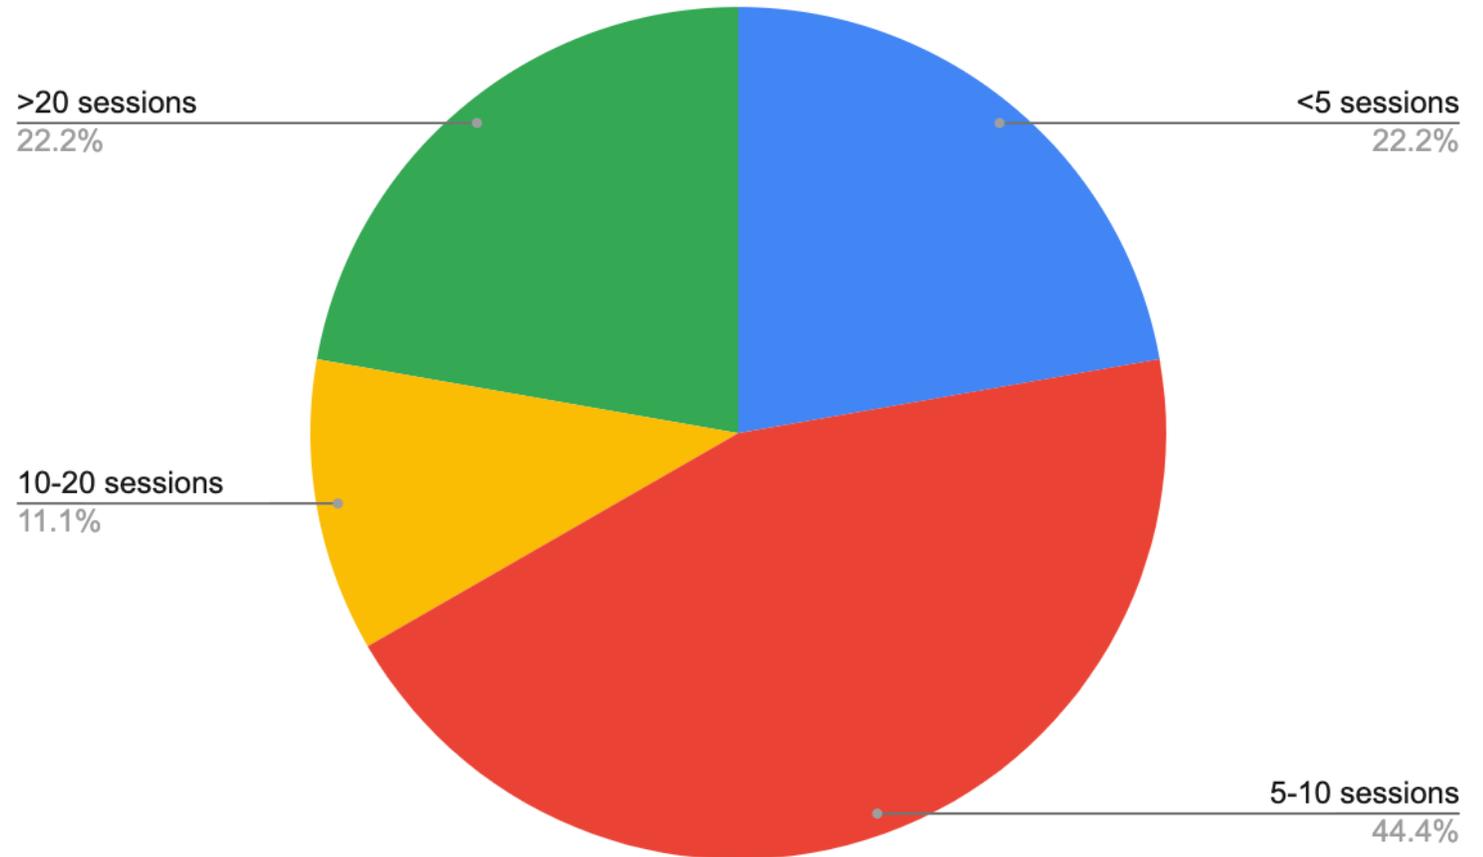

Survey 2

- Completed by 10/17 programs (59%)
 - 5/10 SL, 4/10 PD, 1/10 CBME director

Results

Survey 2

- 9/10 performed SBA of EPAs
- 6/9 developed specific simulation sessions for dedicated EPA assessment

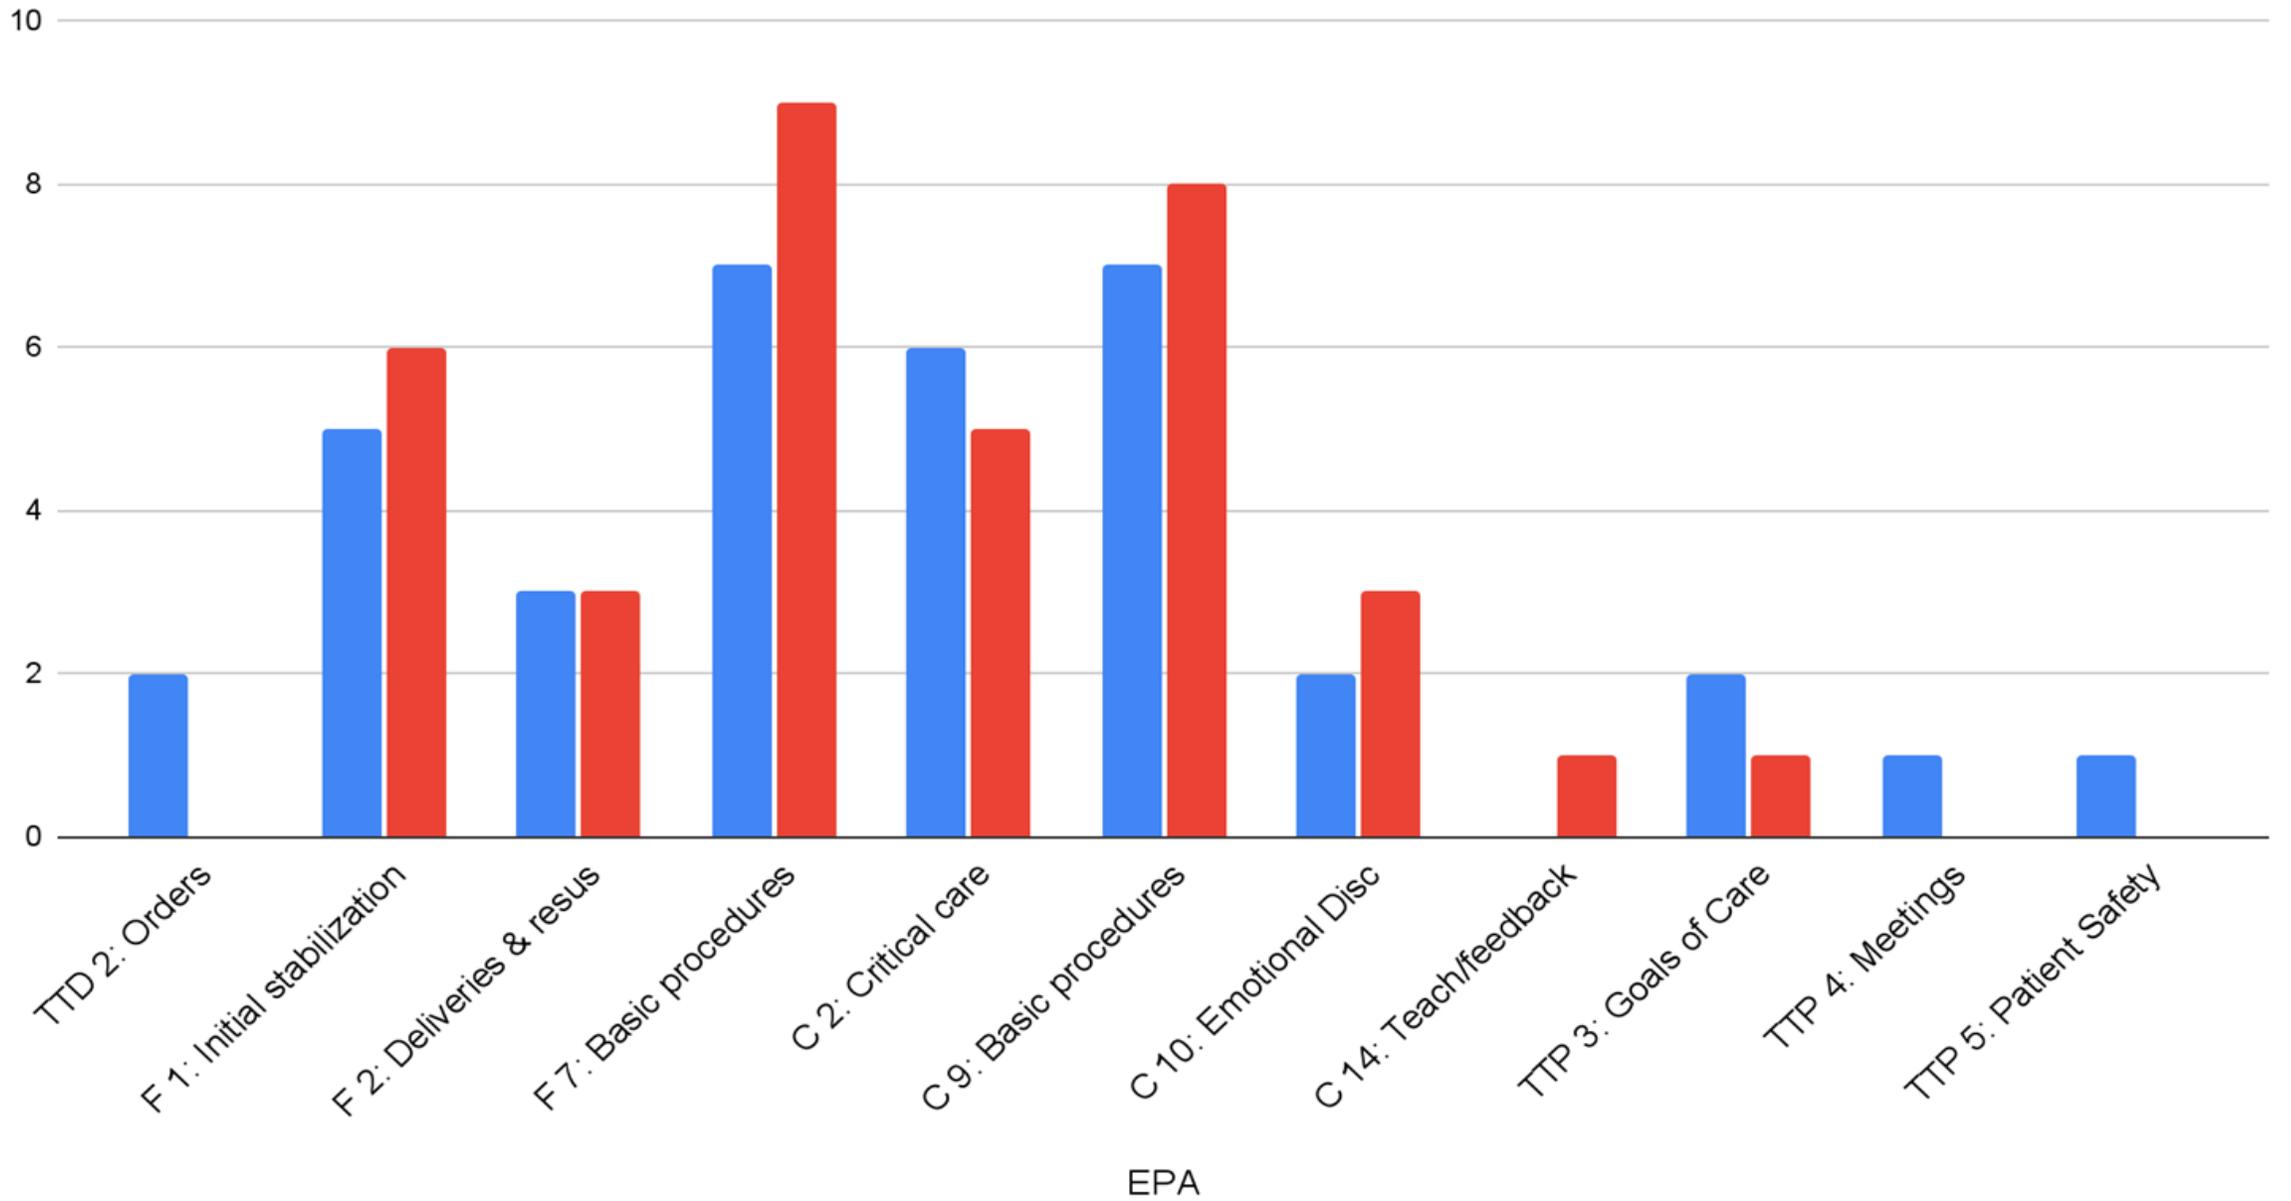

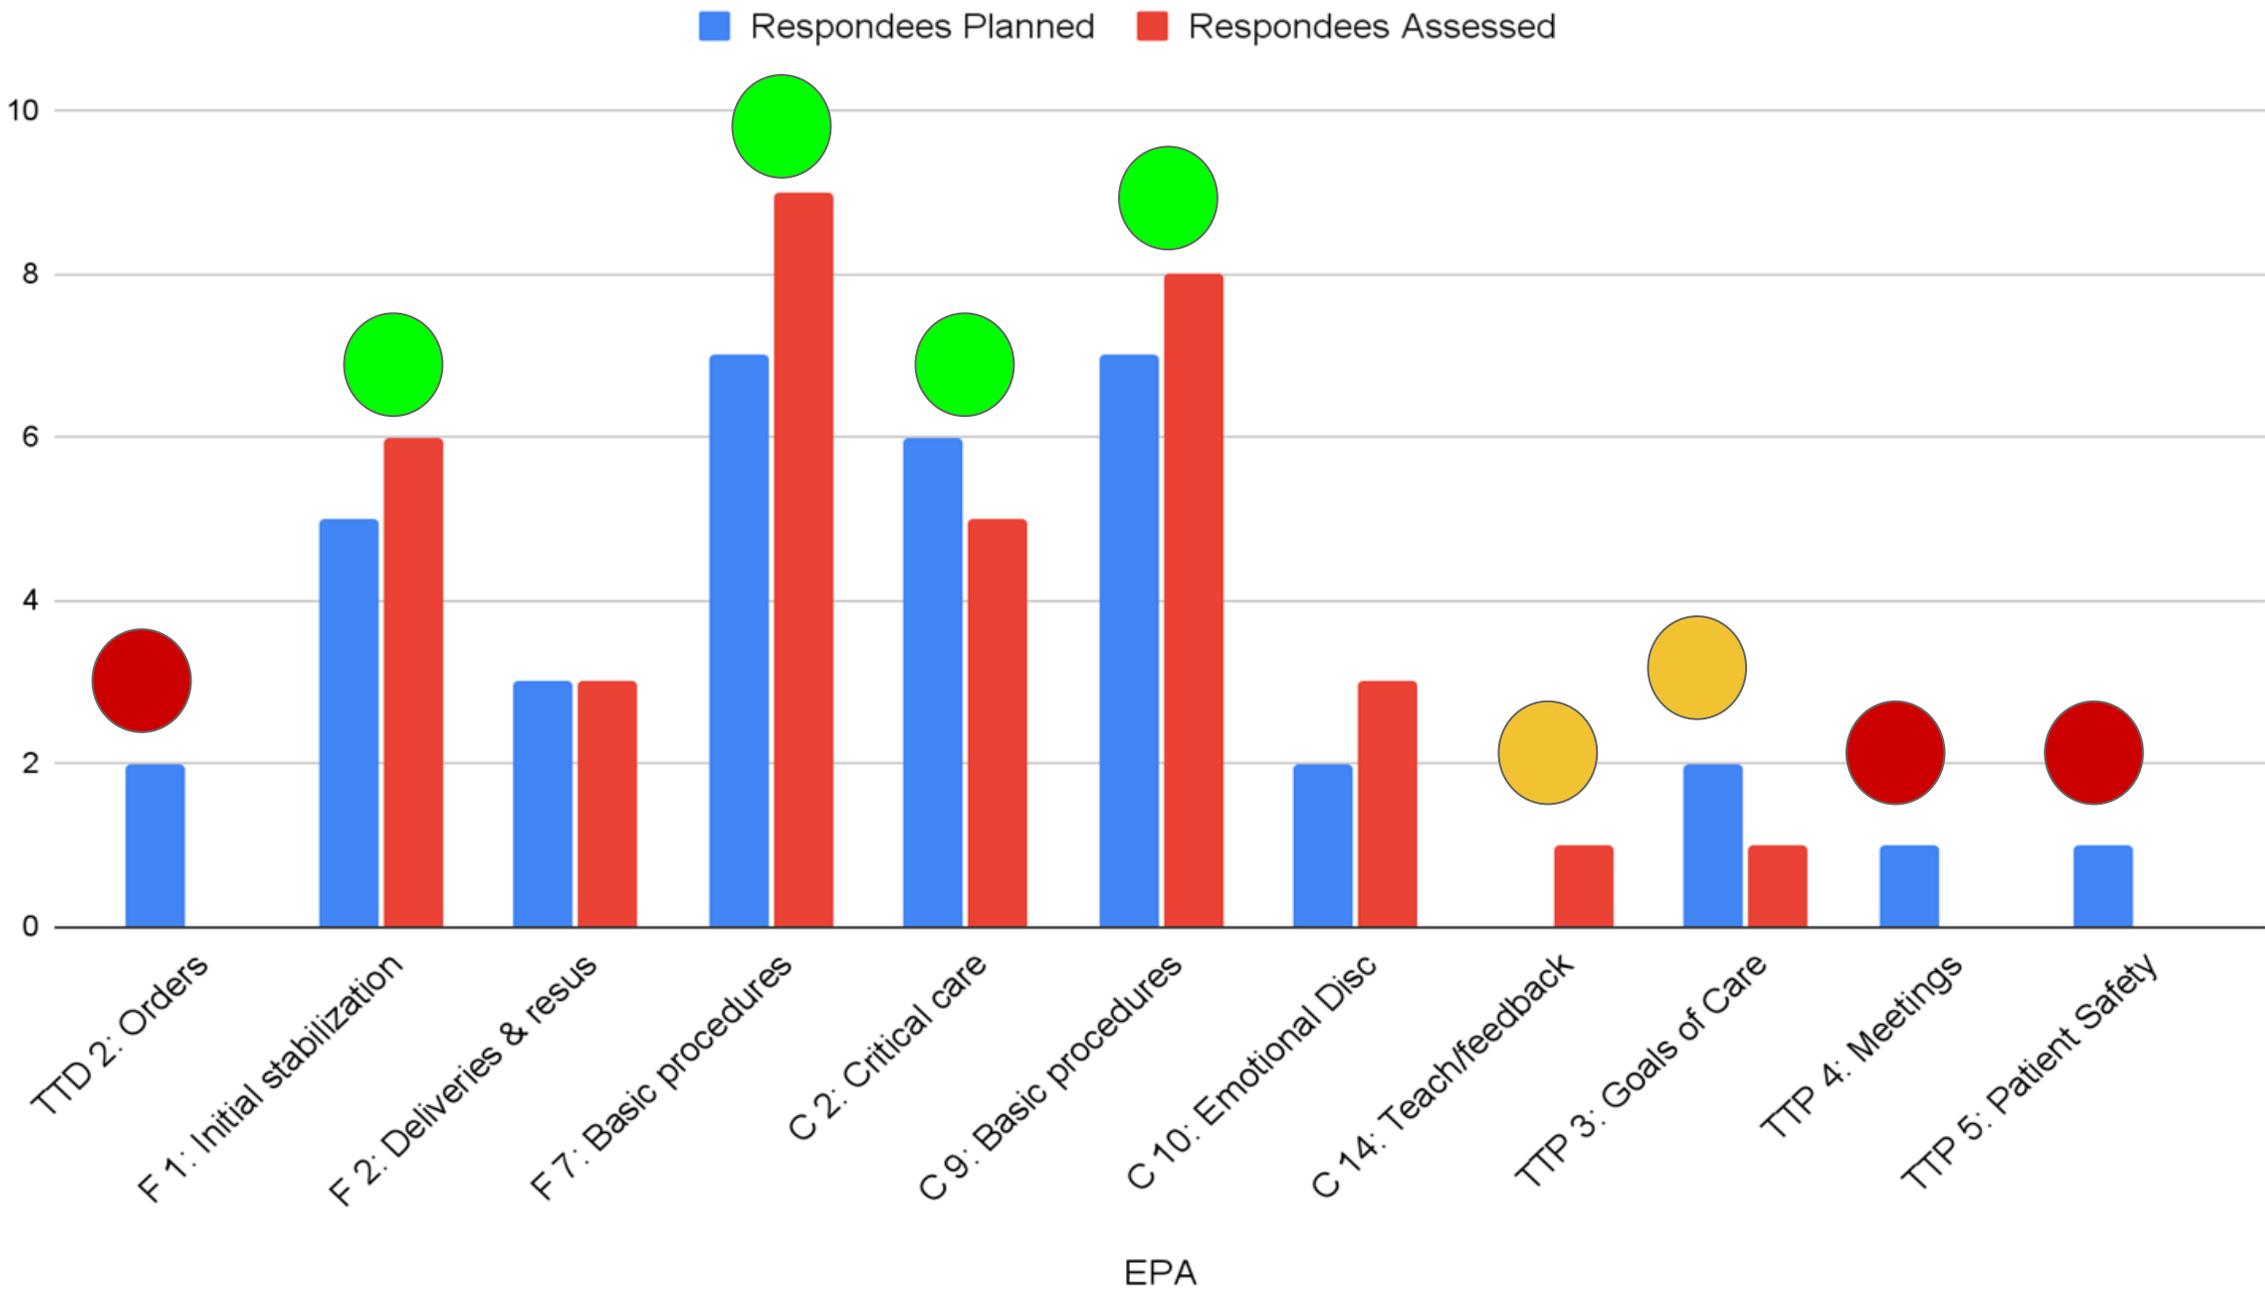

Results

Survey 2

- 5/9 had a separate facilitator present to be assessor; 2/5 provided specific training
- 1/9 used standardized patients

■ Respondees Planned ■ Respondees Assessed

“Hard skills”

Procedural

- Foundation 7: Performing basic procedures (BMV, tracheostomy change, CPR, IO)
- Core 9: Performing basic procedures (injections, chest tube, G-tube, port-a-cath, etc)

Resuscitation

- Foundation 1: Recognizing deteriorating/ critically ill patients and initiating stabilization & management
- Core 2: Resuscitating and stabilizing critically ill patients

“Soft skills”

Communication and critical thinking

- Core 14: Providing teaching and feedback
- TTP 3: Leading discussions about goals of care

- TTP 4: Leading family and interprofessional team meetings
- TTP 5: Analyzing patient safety events to improve quality of care
- (TTD 2: Documenting orders for pediatric patients)
 - Suspected due to ample clinical opportunity for completion

Results

Survey 2

What was successful about the incorporation of EPA assessments into simulation curriculum?

- **Procedural** exposure and assessment (6/9)

“Sim tends to be a great place to focus on **procedural skills**”

“Better tracking of **procedural** competencies”

“More opportunity for **acute care and procedural assessment**”

Results

Survey 2

What challenges or impacts to your curriculum did you encounter?

- **Increased resource requirements (8/8)**

"[Need for] **curriculum** designed around sim-amenable EPAs"

"**Takes more time** than expected."

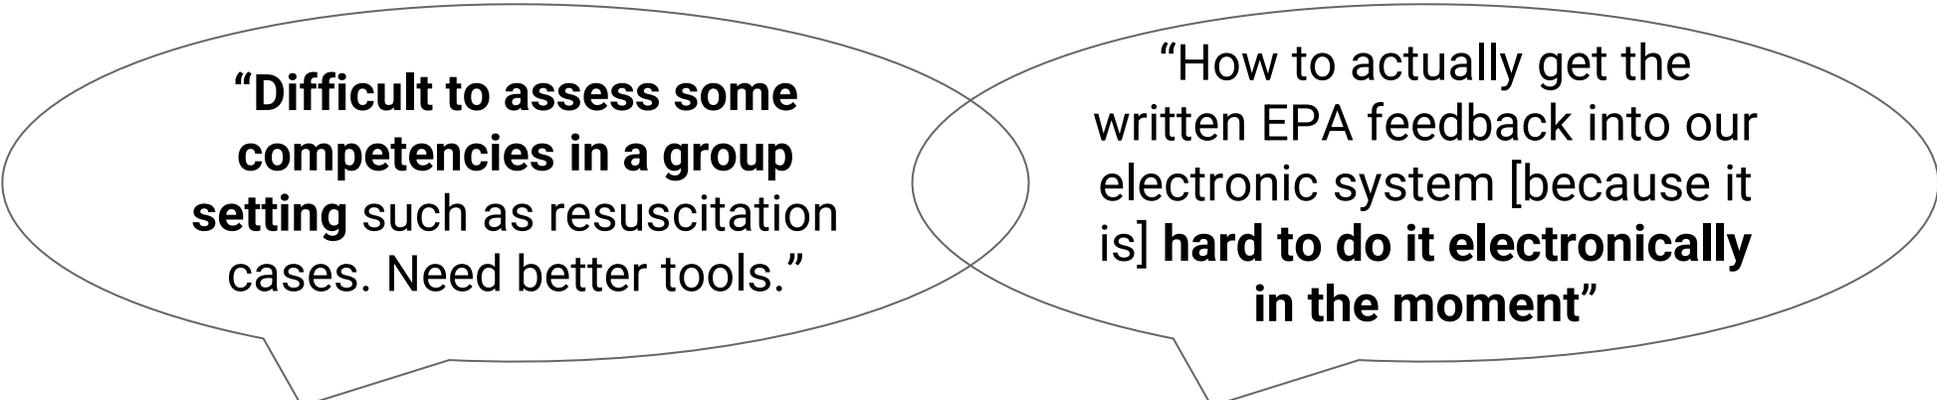

"Required **rearranging** the timing of courses, building in **extra time** to complete the EPAs on the online system, **faculty training**"

"**Dedicated evaluators** to provide meaningful feedback."

"**Finding time and facilitators** to sign off"

"We have **tailored our curriculum** to ensure that we hit some of the harder to hit procedures"

- **Assessment tool limitations**

“Difficult to assess some competencies in a group setting such as resuscitation cases. Need better tools.”

“How to actually get the written EPA feedback into our electronic system [because it is] **hard to do it electronically in the moment**”

2 programs indicated they used print-outs of EPAs, written on by evaluators, and submitted to program admin to upload online

- Resident expectations, frustrations and welfare

“Residents are looking to get EPAs during simulation and are sometimes **frustrated** that this cannot be routinely done”

“Positive [resident feedback], but **want many many more**”

“[Resident] concern that they won’t be **scoring high enough**”

“*Should* sim have EPAs?”

Discussion

Discussion

Increased resource burden
associated with SBA of EPAs

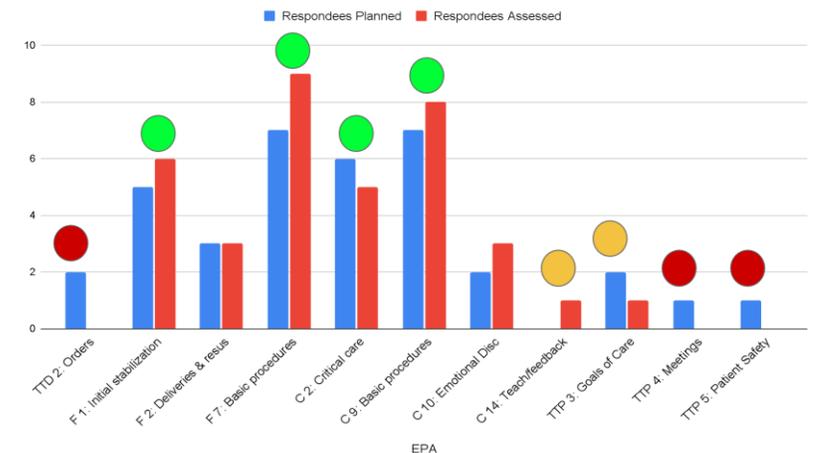

curriculum

assessors

assessment
tools &
strategies

1. Curriculum

- Simulation scenarios & sessions
 - “mapped” alongside residents’ timelines as they progress through stages
 - ? standardized patients
- Certain EPAs more readily assessed than others...
 - “hard skills” vs “soft skills”

2. Assessors

- Shift from sim for learning → sim for assessment
- Assessor availability, time, training, compensation

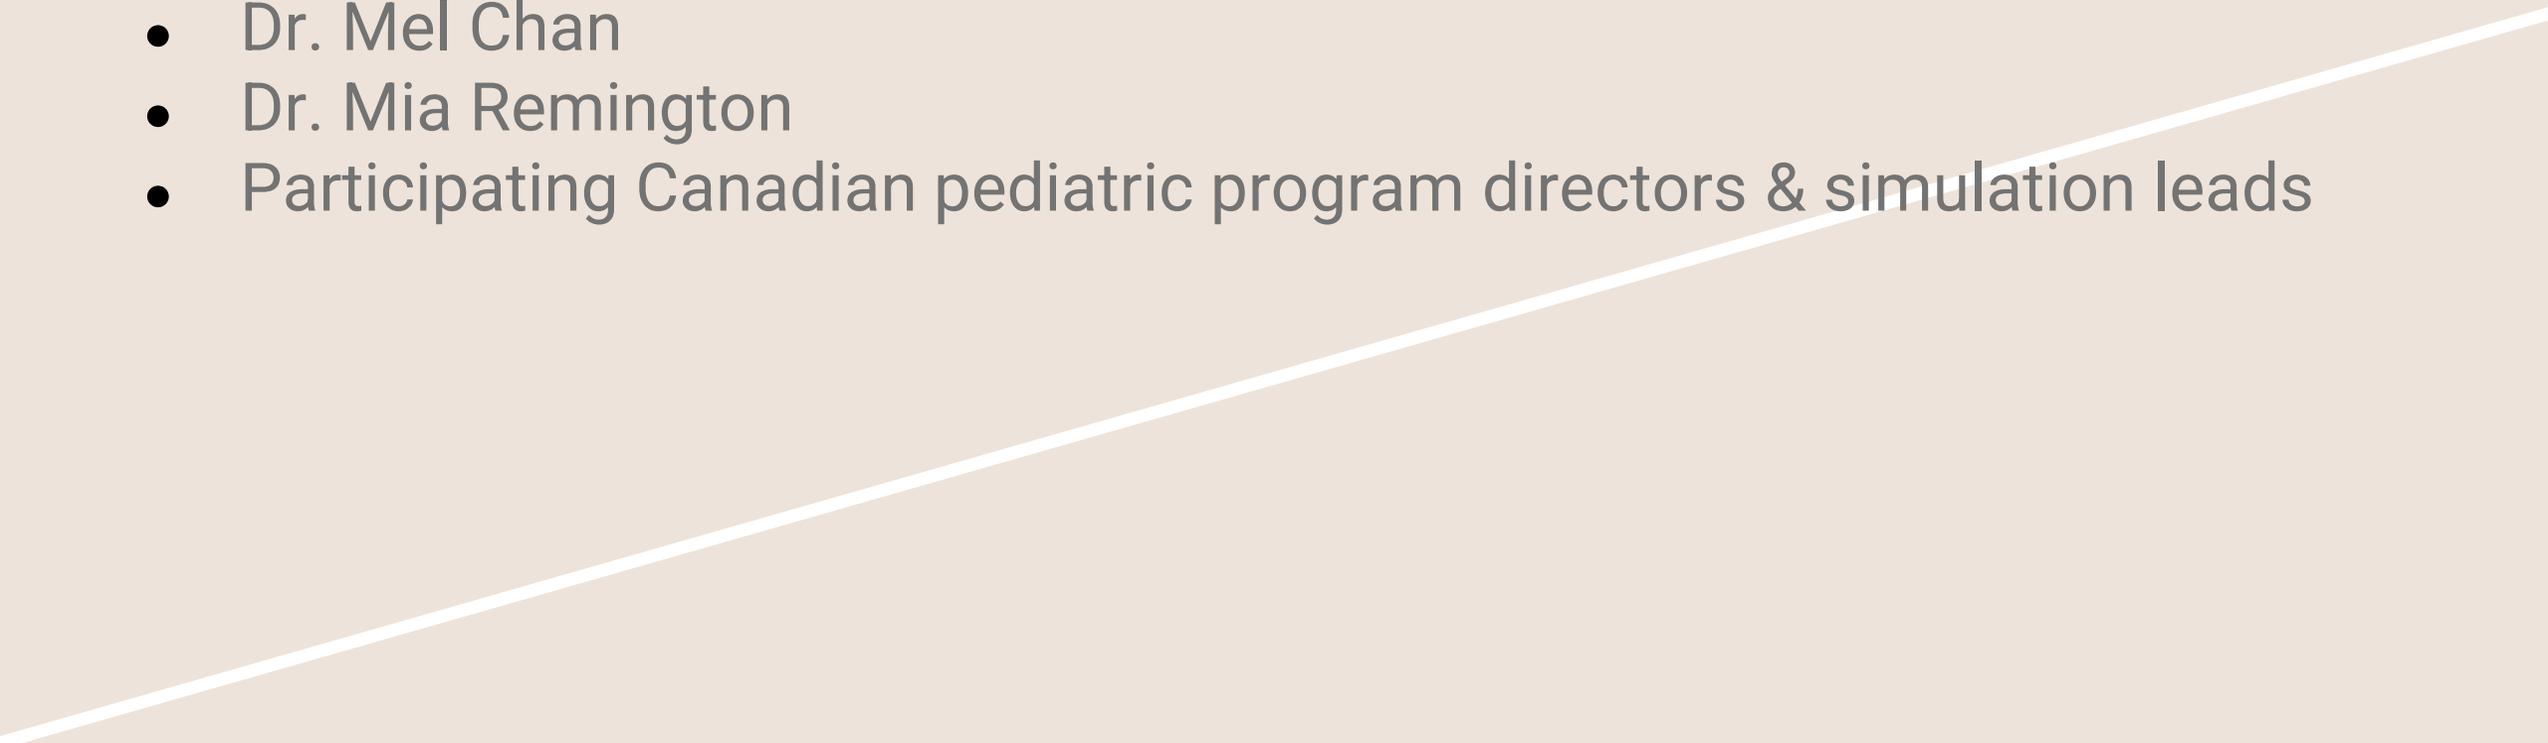

3. Assessment tools and strategies

- Shift from group evaluation → individual evaluation
- Need for better tools
- Need for more practical assessment; is the present format of EPAs the right fit for simulation as its currently structured?

Future directions

- Resident perspective
- Psychological impact of SBA of EPAs
- Targeting “soft skill” assessment
- Workshopping tools for completing assessments more effectively & practically
- Knowledge sharing between Peds and non-Peds CBD programs

Acknowledgements

The Evaluation of the **Live 5-2-1-0** Healthcare Provider Toolkit in the General Pediatrics Clinic at BC Children's Hospital

Radhika Shankar, MSc, MD, Kimberley Charbonneau, MPH, Christina Tang, MA, Molly Sweeney Magee, PhD, Selina Suleman, MPH, Shazhan Amed, MSc, MD, FRCPC

Land Acknowledgement

I respectfully acknowledge the land on which we work, live, and play is the traditional territory of the Coast Salish peoples, including the unceded homelands of the x^wməθkwəy̓əm (Musqueam), Skwxwú7mesh (Squamish), and sə́lílwətaʔ (Tsleil-Waututh) Nations.

LIVE 5-2-1-0 Initiative

Enjoy-

FIVE or more vegetables & fruits every day

Power down-

no more than TWO hours of screen time a day

Play actively-

at least ONE hour each day

Choose healthy-
ZERO sugar-sweetened drinks

Background

- Increase in childhood obesity over the past 4 decades in Canada
- Health care providers (HCPs) play a critical role in addressing childhood obesity
- Physical activity counseling & incorporating questions about weight management into patient visits in health care settings has been shown to improve physical activity levels amongst patients

Rodd C, Sharma AK. Recent trends in the prevalence of overweight and obesity among Canadian children. *CMAJ* 20, 2016 vol. 188 no. 13, (E313-E320).

Barlow SE. Expert committee recommendations regarding the prevention, assessment, and treatment of child and adolescent overweight and obesity: Summary report. *Pediatrics*

Background

- Study showed that less than 1/3 pediatricians understood physical activity guidelines for kids
- HCPs can be supported by providing a clear framework and easy-to-use tools for them to learn the basics of motivational interviewing and healthy living counselling (HLC) recommendations to encourage healthy behaviours in their patient population

Objective of Overall Project

- To collaborate with HCPs and families to create a LIVE 5-2-1-0 HCP Toolkit that can be used in the outpatient pediatric setting

Objective of my Research

- To determine whether the implementation of the LIVE 5-2-1-0 HCP Toolkit improves HLC to patient and families in the General Pediatrics Clinic at BCCH

Methods

Methods: Needs Assessment

- Needs Assessment Survey distributed to **HCPs**

- **50%** had lack of confidence discussing issues around weight
- **81%** thought healthy behaviours should be addressed in their clinical area
- **80%** thought they could improve their counselling

- Needs Assessment Survey distributed to **families**

- **68%** agreed or strongly agreed that discussing healthy living habits with HCP at BCCH would help their child improve healthy behaviours
- **80%** thought it was important or very important to get information about healthy living habits while visiting BCCH

Methods: Intervention (LIVE 5-2-1-0 Toolkit)

1. Training

MOTIVATIONAL
INTERVIEWING

A healthcare provider's guide to respectfully discuss weight with pediatric patients and their families

2. Printed Resources & Tools

Healthy Habits Questionnaire
to be filled out by parent or child for ages 2-5

Child's full name: _____
Age: _____ Today's date: _____

We want to provide the best care for your child, and the best care starts with healthy habits. All these habits are important for your child's long-term health. Please take a few minutes to answer the following questions. There are no right or wrong answers. We just want to know how you are doing.

Has anyone in your family ever been diagnosed with:

Diabetes (not just gestational)	<input type="checkbox"/> No <input type="checkbox"/> Yes	High blood pressure	<input type="checkbox"/> No <input type="checkbox"/> Yes
High cholesterol	<input type="checkbox"/> No <input type="checkbox"/> Yes	High blood cholesterol	<input type="checkbox"/> No <input type="checkbox"/> Yes
Heart disease (not just coronary)	<input type="checkbox"/> No <input type="checkbox"/> Yes	Obesity	<input type="checkbox"/> No <input type="checkbox"/> Yes
Overweight/obesity	<input type="checkbox"/> No <input type="checkbox"/> Yes		

How many times per day of vegetables or fruits does your child eat (ages 2-5)?	0-1 times	2-3 times	4-5 times	6+ times
How many times per day does your child drink water (not just juice, soda, or other sugary drinks)?	4+	3-4	2-3	1
How many times per week does your child physically active for at least 30 minutes by walking, biking, playing?	0-1 times	2-3 times	4-5 times	6-7 times

PREVIEW

Live 5-2-1-0 Family Physician Toolkit: Healthy Habits Questionnaire

Live 5-2-1-0

Setting the stage for a healthy childhood
Raising a healthy eater – birth to 12 months

Feeding your child is one of your most important jobs as a parent. It's how we help our children grow, health and strong. Creating good habits and routines sets a child up for a lifetime of healthy eating.

Birth – 6 months
Feed your baby when they are hungry. Some babies will cry to tell you they are hungry. In a hospital, they often cry. But your baby knows how to tell you when they are hungry. Respond to their cues.

6 – 12 months
Parental caregiver duties:
• Offer a variety of fruits and vegetables
• Offer a variety of textures
• Offer a variety of colors

Child duties:
• Eat with you
• Try new foods
• Enjoy eating

Parental caregiver responsibilities:
6 – 12 months

You decide when to offer solid food
As soon as your baby is willing to hold a spoon in their mouth, you can start offering solid food. This is usually between 6 and 9 months of age. Offer a variety of textures and colors. Offer a variety of colors. Offer a variety of textures. Offer a variety of colors.

Best foods when to offer solid food
Offering solid food to your baby. This is usually between 6 and 9 months of age.

3. Training in the Appropriate Use of Printed Resources and Tools

Methods: Study Design

Retrospective chart review of 350 randomized patient visits between January 2018 – December 2018 (Pre-Toolkit Implementation Period) & May 2019 - March 2020 (Post-Toolkit Implementation Period)

Methods: Inclusion/Exclusion Criteria

Inclusion Criteria:

- In-person patient visits in the General Pediatrics outpatient clinic at BCCH before and after the implementation of the toolkit between January – December 2018 and May 2019 – March 2020, respectively
- Paper or online documentation for medical visits

Exclusion Criteria:

- Phone or virtual visit
- Absence of online and paper chart documentation of visit
- Patient absent during visit
- Patient participation in the intervention arm of the LIVE 5-2-1-0 App Pilot Study

Methods: Data Collected

Growth Tracking

**Documentation of
Healthy Living
Discussions**

**Documentation of
Healthy Living
Recommendations**

**Referrals to Support
Healthy Living
Recommendations**

Methods: Statistical Analysis

- Collection of data on REDCap
- Used Wilcoxon Signed-Rank Test and Chi-Squared test

Conclusion & Take aways

- Empowering pediatricians with the appropriate tools, training and education has shown to increase:
 - Growth tracking
 - Healthy living counseling
 - Referrals made to support healthy living recommendations
- Great potential of LIVE 5-2-1-0 HCP Toolkit to enhance HCP abilities to reassess patients' health behaviours, and intervene to support change in these behaviours when necessary

Dr. Asia van Buuren

Far from home: The impact of geographic distance from tertiary pediatric hospitals on family expenses and experiences

Celebrate Research Day 2024

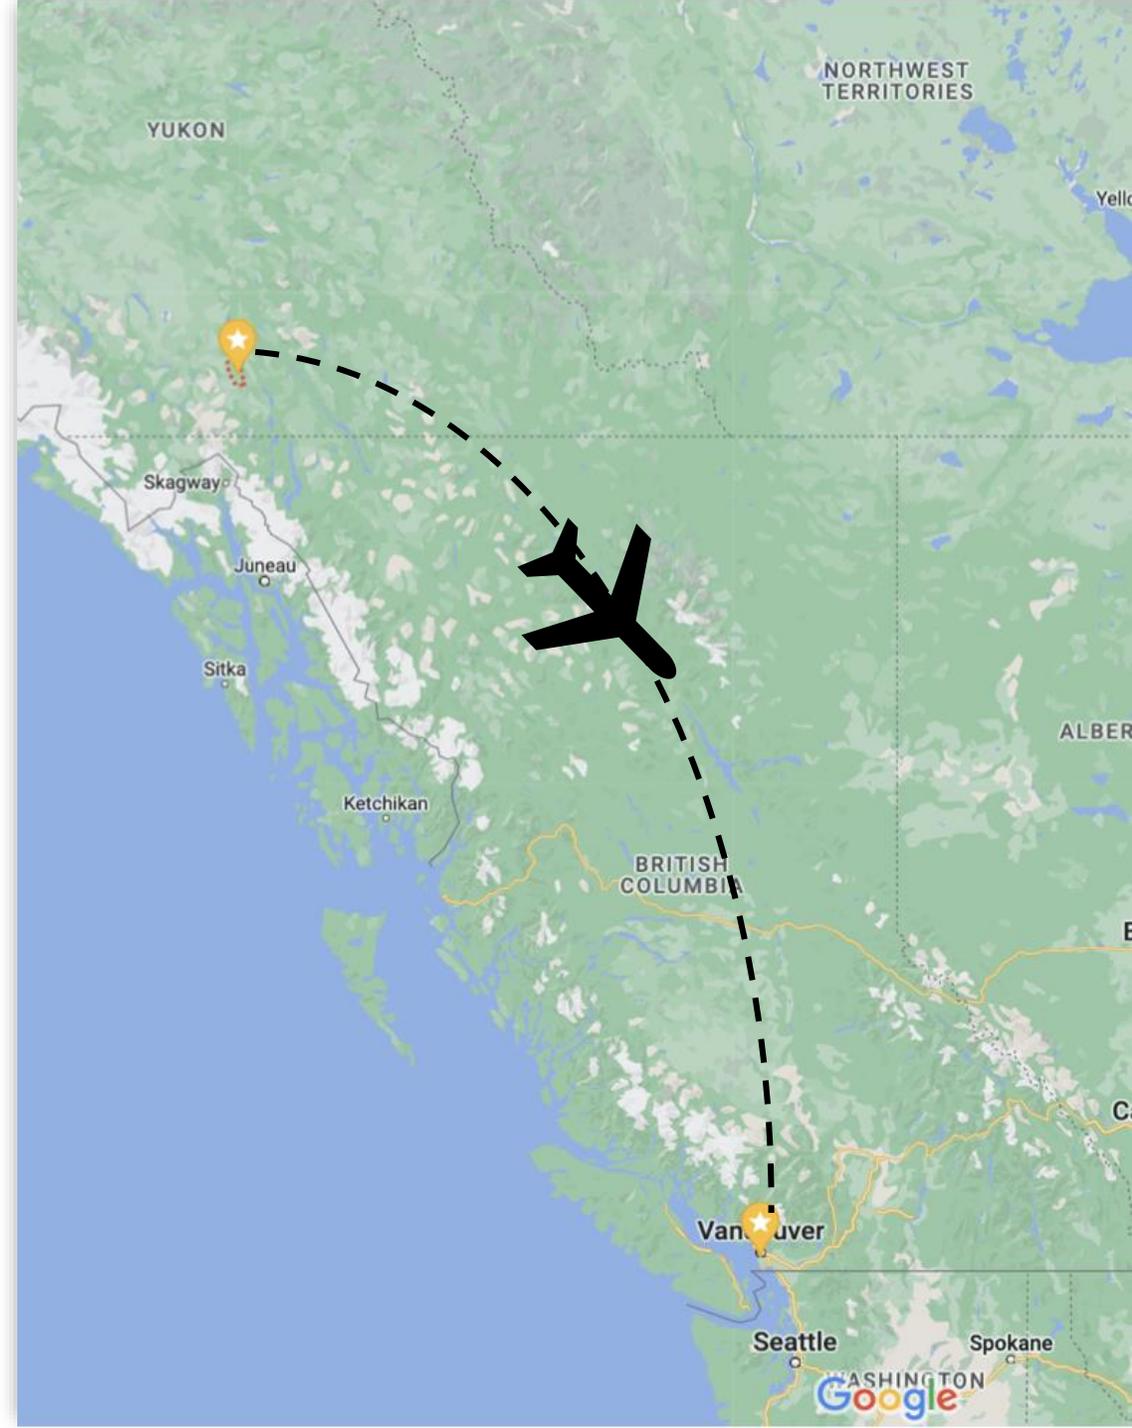

Research Team:

Asia van Buuren, Adam Sage,
Adam Sernoskie, Brittney Udall,
Matthew Carwana

Background

- Canada's **expansive geography** creates barriers for children requiring tertiary pediatric care
- **Significant barrier** to achieving health equity for these patients
- International literature shows traveling to receive care causes **emotional distress** and **financial burden** for rural families (Cohn 2003; Tarnasky et al. 2021; Zucca et al. 2011; Kornelsen et al. 2021)
- **Lack of available literature** on the experiences of Canadian children and their families despite them being a **significant proportion** of who we care for

Project Overview

Ethics approval obtained
through the UBC C&W REB

Mixed-methods study design
grounded in patient-centered
research principles through
involvement of family partners

Part 1: Administrative Data

- Analysis of data set describing length of stay and home community of patients admission to CTU in 2021
- *Objective: Describe the population*

Part 2: Survey Data

- Descriptive, self-administered, 15-20 minute survey administered to CTU families
- *Objective: Capture costs and psychosocial impacts of hospitalization*

Part 3: Qualitative Data

- Semi-structured, one-on-one, qualitative interviews to gain in-depth understanding
- *Objective: Understand barriers encountered and potential solutions*

Part 4: Knowledge Mobilization

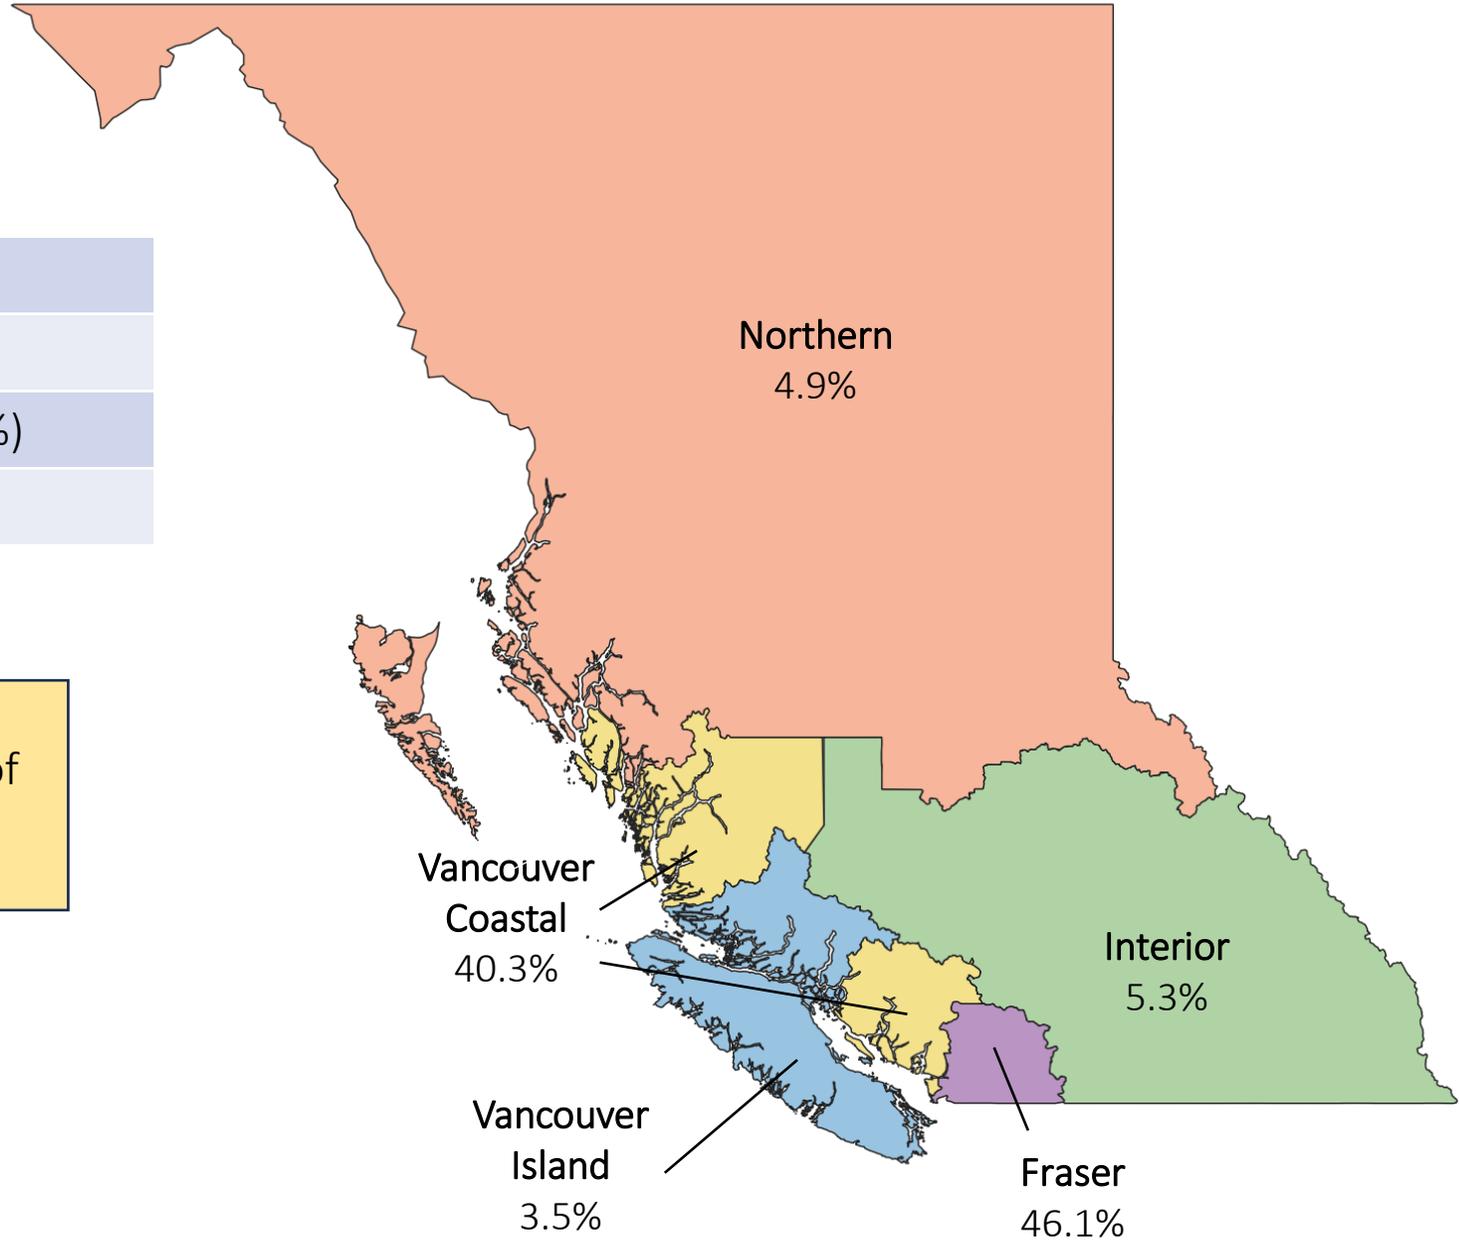

- *Targeted solutions implemented in collaboration with family partners*
- *Objective: Meaningful change!*

A large, diverse crowd of people is shown from an overhead perspective, walking on a light-colored, possibly snowy or sandy, surface. The individuals are dressed in various winter clothing, including jackets, sweaters, and hats, in a wide range of colors like red, blue, orange, and grey. The crowd is dense in the center and more sparse towards the edges. The overall scene is dimly lit, with a dark grey background. The text "Administrative Data" is overlaid in the center of the image in a white, sans-serif font.

Administrative Data

Total Admissions to CTU	2759
Average Distance to BCCH	78.1 km
Patients < 50 km (“Local”)	2119 (77%)
Patients > 50 km (“Away”)	618 (23%)

As distance from BCCH increases, length of stay increases ($p < 0.001$)

A top-down illustration of a workspace. In the center is a laptop with a grey body and a black screen. On the screen, a document is displayed with three rows of text, each preceded by a checkbox. The first and third checkboxes are checked with green checkmarks, while the second is unchecked with a red 'X'. The text in the document is represented by horizontal lines. To the left of the laptop is a spiral-bound notebook with a red bookmark, a pair of black-rimmed glasses, and a white coffee cup filled with brown liquid on a saucer. To the right is a white sheet of paper with a blue pen and a yellow pencil. In the bottom right corner, a hand is shown clicking a mouse. The background is a light green color with faint white plus signs and circles.

Survey Data

Demographics

Characteristic	No. of Participants (%), n = 147
Household Income	
<i>\$0-49,000</i>	26 (18%)
<i>\$50,000-\$99,000</i>	47 (32%)
<i>\$100,000-149,000</i>	27 (18%)
<i>> \$150,000</i>	30 (20%)
<i>Prefer not to answer</i>	17 (12%)
Education Level	
<i>High school or less</i>	29 (20%)
<i>College/Undergraduate</i>	68 (46%)
<i>Post-grad/Professional</i>	43 (29%)
<i>Prefer not to answer</i>	7 (5%)
Average Distance from BCCH (km)	145.4 (min: 1.4, max: 1897.6)
<i>< 50 km ("local")</i>	94 (64%)
<i>> 50 km ("away")</i>	51 (35%)

Univariable Analysis

Distance from home >50 km and total costs accrued by family during hospitalization

Variable	Beta-coefficient	p-value	95% CI
>50km from home	1128.77	0.006	331.34 – 1926.19

Distance from home >50 km and average daily costs accrued by family during hospitalization

Variable	Beta-coefficient	p-value	95% CI
>50km from home	139.09	0.001	57.31 – 220.88

Across both "local" and "away" groups, participants spent on average \$100 per day on out-of-pocket costs

Other Important Takeaways

- 48% of participants took unpaid time off work
- Of those who reported out-of-pocket costs:
 - 26% reported difficulty paying these costs
 - 19% had to borrow money to do so
- Families from > 50 km away had higher stress levels compared to local families in the following areas:
 - Travel-related stress, $p < 0.001$
 - Cost-related stress, $p < 0.001$

RECRUITING CTU FAMILIES!

Help us learn about

The **impact of geographic distance** on families travelling to receive care at **BCCH!**

Families and caregivers of patients are invited to share their experience in a **20 minute survey** which will help us better understand the financial and social complexities facing our families admitted to CTU/ General Pediatrics.

All families and caregivers of patients admitted under CTU/ General Pediatrics are eligible regardless of distance.

Participants will be offered a \$20 gift card.

To learn more about the study, please speak to your medical care team (eg. nurse, physician, discharge nurse).

For questions about the study, please contact Dr. Matthew Carwana (matthew.carwana@w.bc.ca) or Dr. Asia van Buuren (asia.vanbuuren@hsa.ca). This project has been reviewed by the Research Ethics Board (REB #H22-00353).

Interview Data

Methodology

Qualitative descriptive approach (Doyle et al, 2020; Braun & Clark, 2006)

Combination of convenience and purposive sampling techniques

15 caregivers participated in semi-structured interviews via Zoom

Interviews transcribed verbatim → coded using NVivo software → themes/patterns identified

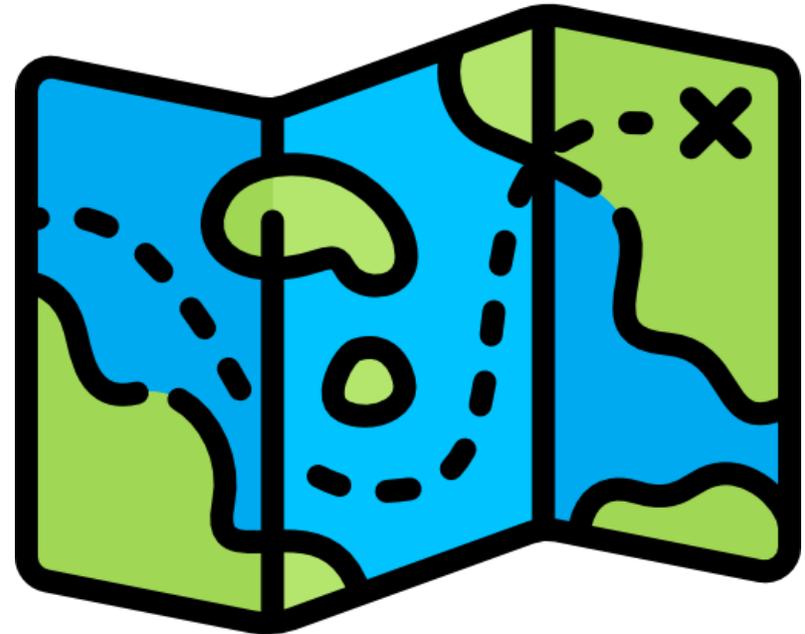

Concurrent analysis and data collection until theoretical saturation achieved

Demographics

Characteristic	No. of Participants (%), n = 15
Age, year <i>Mean</i>	39.2
Health Authority	
<i>Northern</i>	5 (33%)
<i>Interior</i>	3 (20%)
<i>Island</i>	2 (13%)
<i>Vancouver Coastal</i>	1 (7%)
<i>Yukon</i>	4 (27%)
Household Income	
<i>30-49</i>	2 (13%)
<i>50-99</i>	3 (20%)
<i>100-149</i>	6 (40%)
<i>150+</i>	4 (27%)
Indigenous	
<i>Yes</i>	3 (20%)
<i>No</i>	12 (80%)

Far from home families...

1. ...experience heightened overwhelm and uncertainty when admitted to our hospital
2. ...described a geographical tension, where physical separation from their community is challenging and discharge planning is complex
3. ...identify self-advocacy as critical to having their needs met
4. ...have unique resource challenges and propose a wealth of innovative solutions to address these challenges

1. Far from home families experience heightened overwhelm and uncertainty when admitted to our hospital

When families arrive, they are adjusting to a new hospital and a new city they may not have visited before

Uncertainty, overwhelm, and **fear** were key emotions described by interview participants

Some described a tension between being present for their sick child and being **overwhelmed by the logistical aspects** of admission

1. Far from home families experience heightened overwhelm and uncertainty when admitted to our hospital

Q2: “So there's always the craziness of dealing with the medical condition. But like we have the added complication of like, how far we've just had to come, and the fact that we've had to abandon like our home and any support networks that we have...**Which means, like, we're starting behind....**”

2. Far from home families described a geographical tension, where physical separation from their community is challenging and discharge planning is complex
- Many families described feeling **socially isolated** during admission
 - Despite physical separation, **community-based care** models were key supports for families
 - Discharge was often **complex** for these families
 - Discharge often **heightens financial stressors** – many pay out-of-pocket for flights and hotels to bridge them home
 - There is a tension between wanting to return home and knowing families will be far away from acute care resources
 - Families appreciated when discharges were **collaborative, family-centered, and considerate of logistical barriers**

2. Far from home families described a geographical tension, where physical separation from their community is challenging and discharge planning is complex

88: “the hardest parts were like being away from like your community of people...it really felt like I was...on my own in this place...**it almost felt like I was like putting a strain on a medical system that I wasn't really a part of.**”

Q6: “We lucked out in **our village really came together.** Our parents both ended up like giving us some money, for...whatever we needed it for. [Without that]...**we would've been worse off.**”

77: “I hope it doesn't come to a point when we don't get lucky, because...**we have been re-evaluating...where we live and stuff...We don't want to move.**”

3. Far from home families identify self-advocacy as critical to having their needs met

Participants described **advocating** for their child and their family's unique needs

Longitudinal relationships with care providers were supportive in navigating the self-advocate role

When unexpected barriers to accessing resources arose, families implemented **creative solutions**

3. Far from home families identify self-advocacy as critical to having their needs met

77: “We're very vocal. We're very squeaky...But we...come from a, a background of relative privilege...**we talk about how fortunate we are to be able to show up in this way.**”

4. Far from home families experience unique resource challenges and propose a wealth of innovative solutions to address these challenges

- Families learn how to navigate resource challenges **through lived experience** and are eager to share that knowledge with other families
- 100% (n=15) of participants agreed **immediate connection to social work** for those who travelled should be put in place
- 87% (n=13) of participants shared a **preference for investment in targeted resources** rather than being given cash or a stipend
- 87% (n=13) of participants felt that **formal acknowledgement** by their medical teams of the distance they had travelled was helpful

4. Far from home families have unique resource challenges and propose a wealth of innovative solutions to address these challenges

Q6: “And you don't even know what you need for the first little while, right? Because you're so just jacked up on emotion. And and **you're sort of not too sure where to begin** even so, **to have those people meet you right at the door** and say...these are the people that are gonna help you...”

Conclusions & Next Steps

Key Takeaways

Far from home families admitted to hospital spend an average of **\$140 per day** on out-of-pocket costs and have **significantly higher costs** than local families

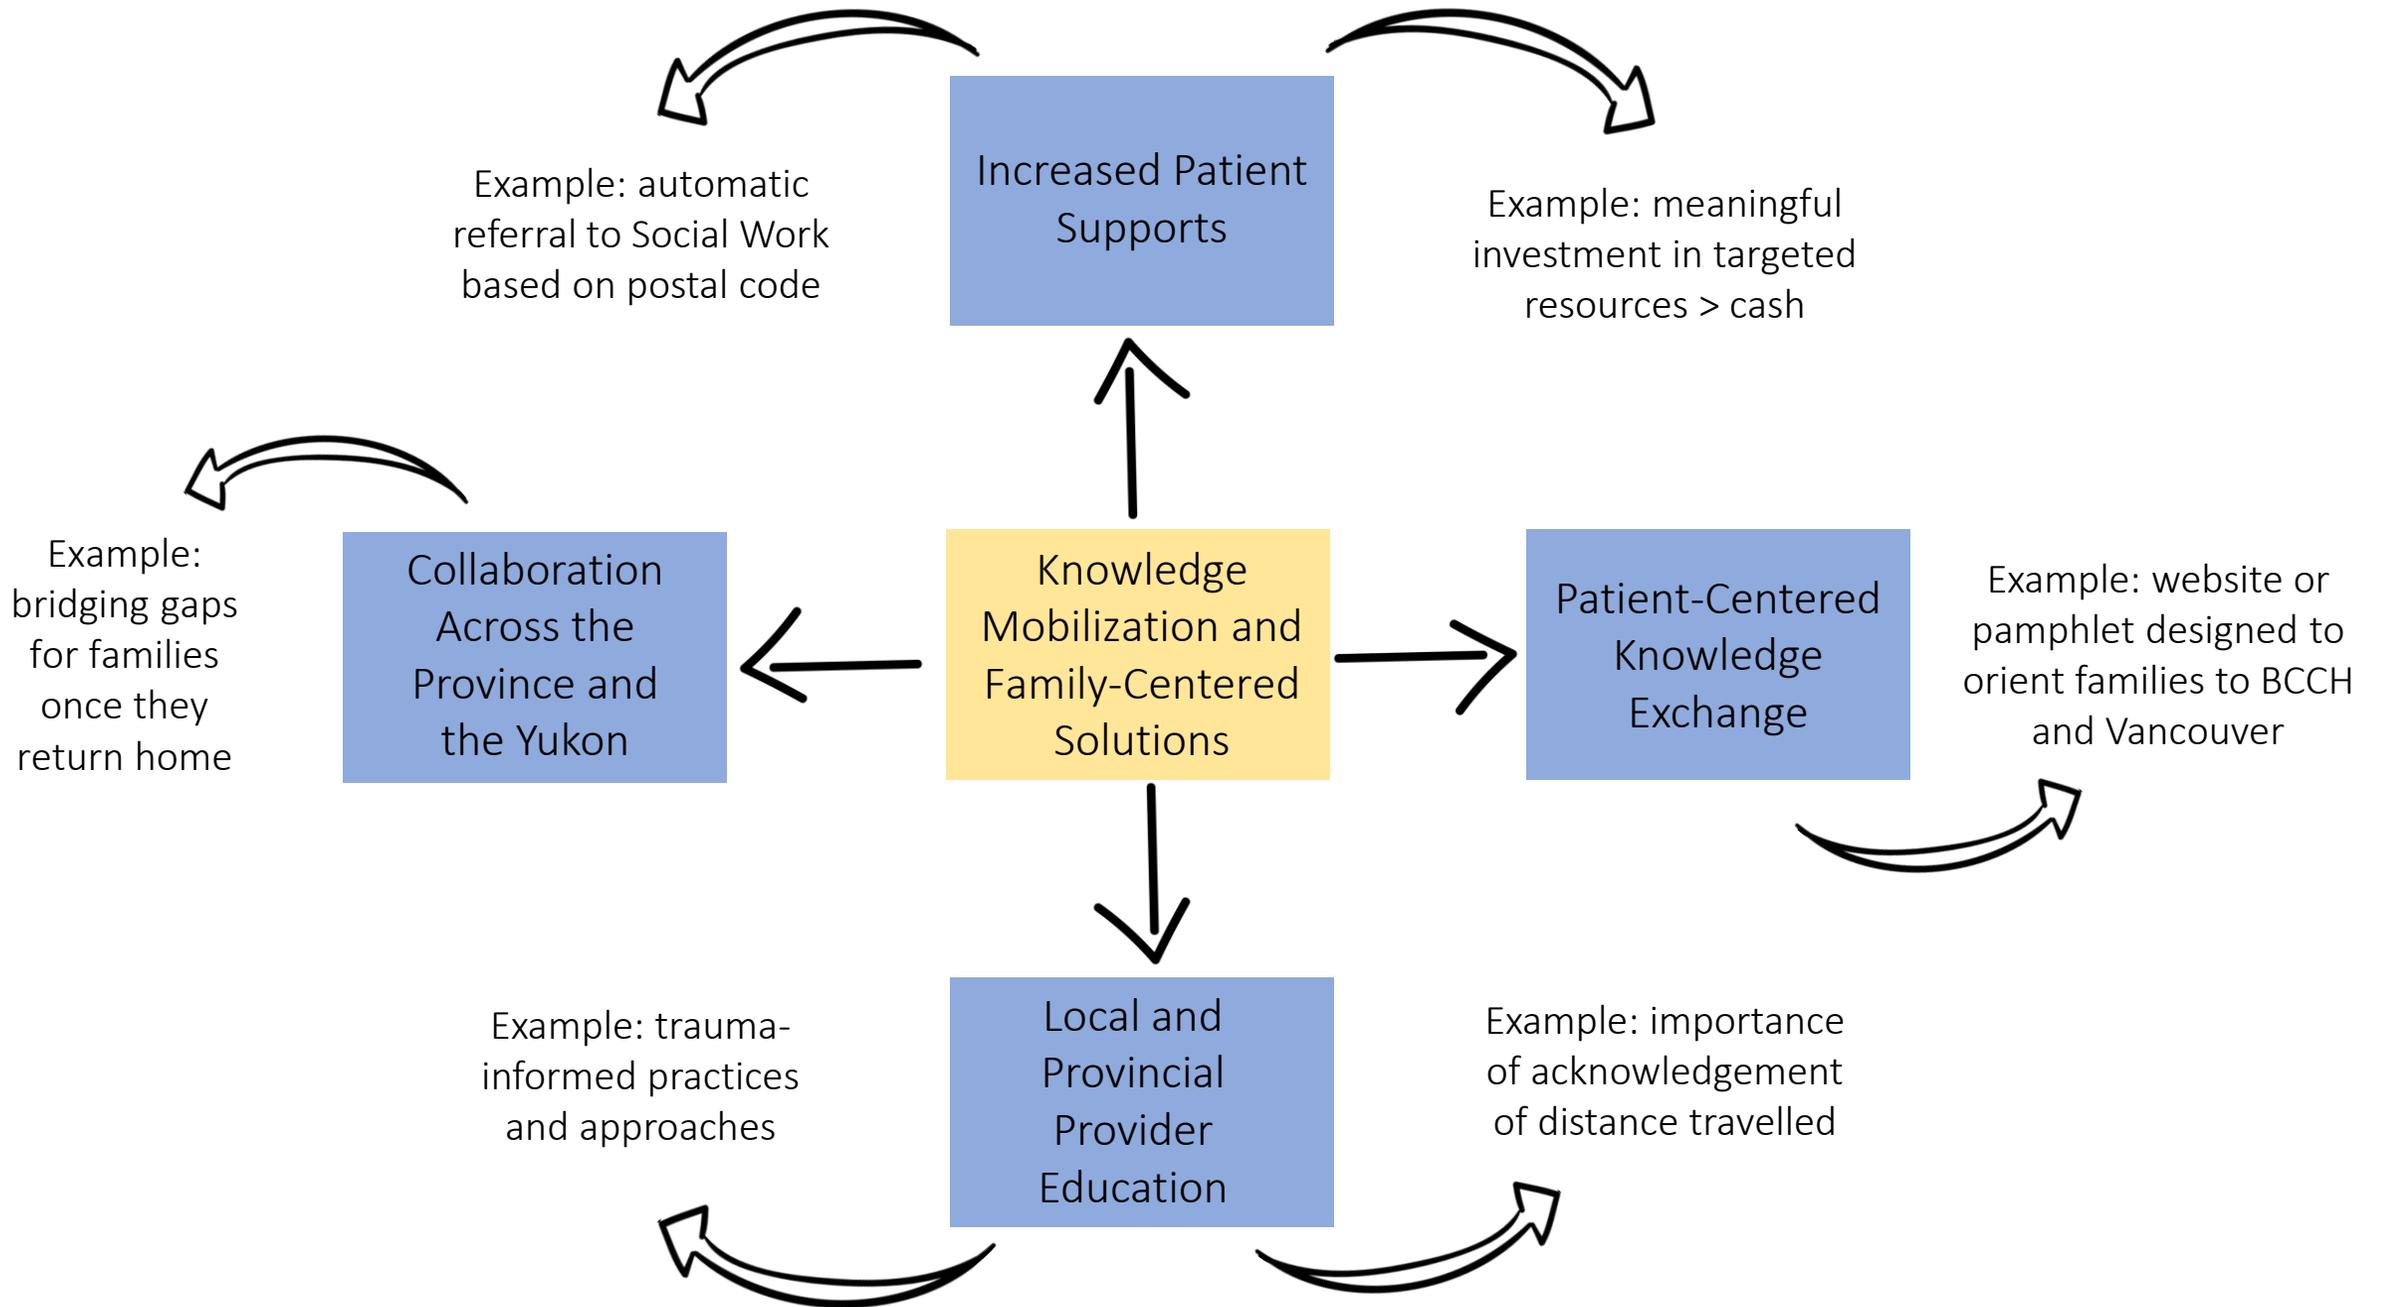

Many families reported **difficulty paying** these costs, with families from away reporting **higher stress levels** than local families

Families face **overwhelming uncertainty** while admitted, often interfering with their capacity to be present for their child and navigate logistics

Self-advocacy is important to these families - **they know what they need** and have described tangible solutions to barriers faced
